Start with One Specific Question for LHC

- KK Graviton couples to SM through energy-momentum tensor

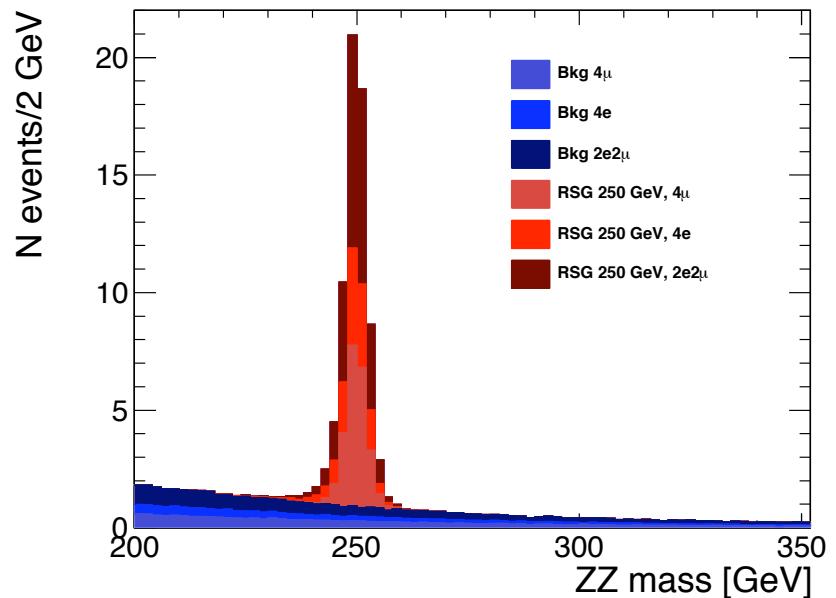

$$A \propto \frac{1}{\Lambda} t_{\mu\nu} T^{\mu\nu}$$

- consequence: $J_z \neq 0$
- only a model (“minimal”), try most general approach
- spin correlations \Rightarrow spin determination, and a lot more...

Questions

- If resonance is observed on LHC
 - mass, width, rate, branching
 - quantum numbers?
 - couplings to SM fields?
 - maximum information?

- Build on recent experience in B -physics

production $e^+e^- \rightarrow \Upsilon \rightarrow B\bar{B}$ (analogy to $q\bar{q} \rightarrow X$)

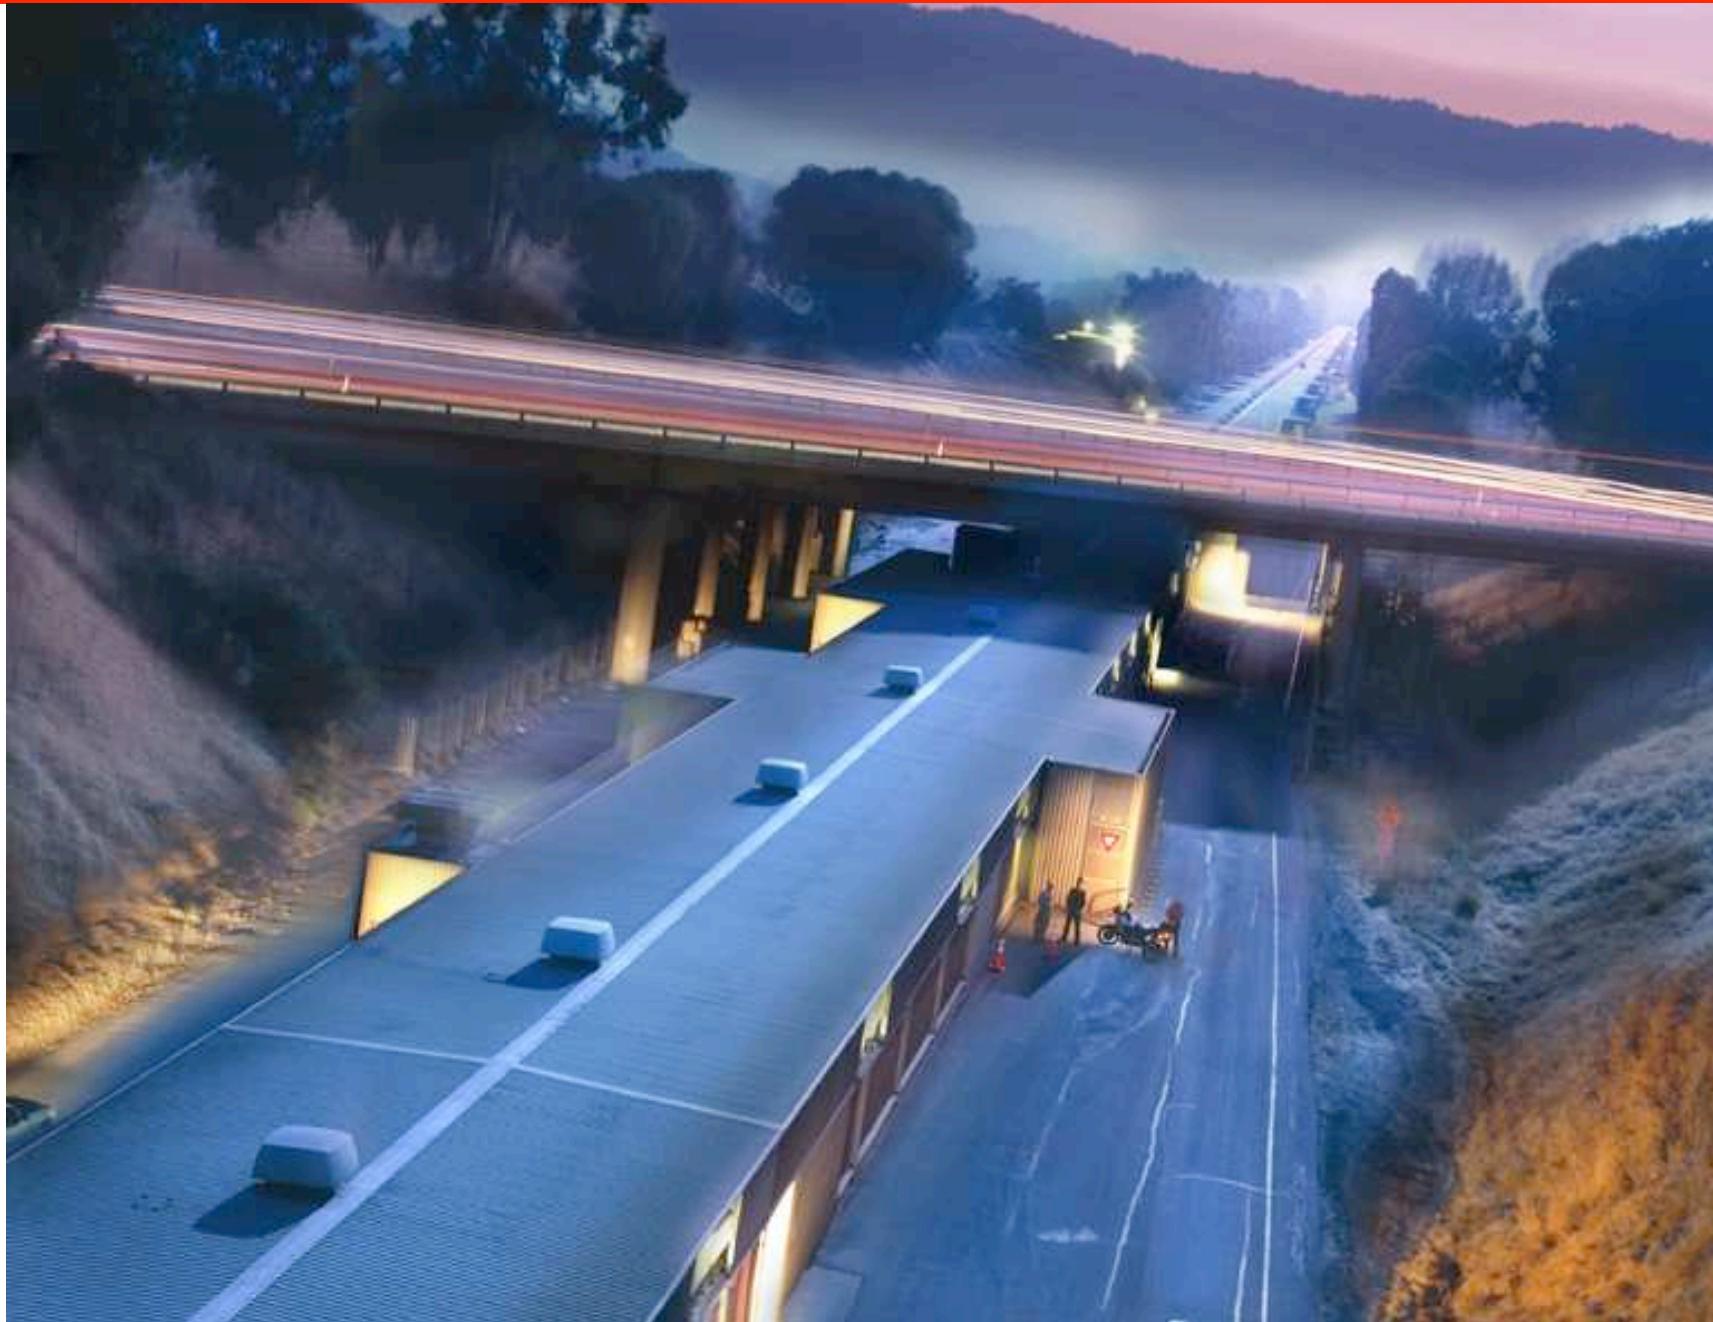

decay $B \rightarrow VV$ (analogy to $H \rightarrow VV$)

weak and strong interaction dynamics (effective couplings)

build on full angular/helicity formalism

- There is a long history (e.g. $\pi^0 \rightarrow e^+e^-e^+e^-$; $e^+e^- \rightarrow J/\psi \dots$)

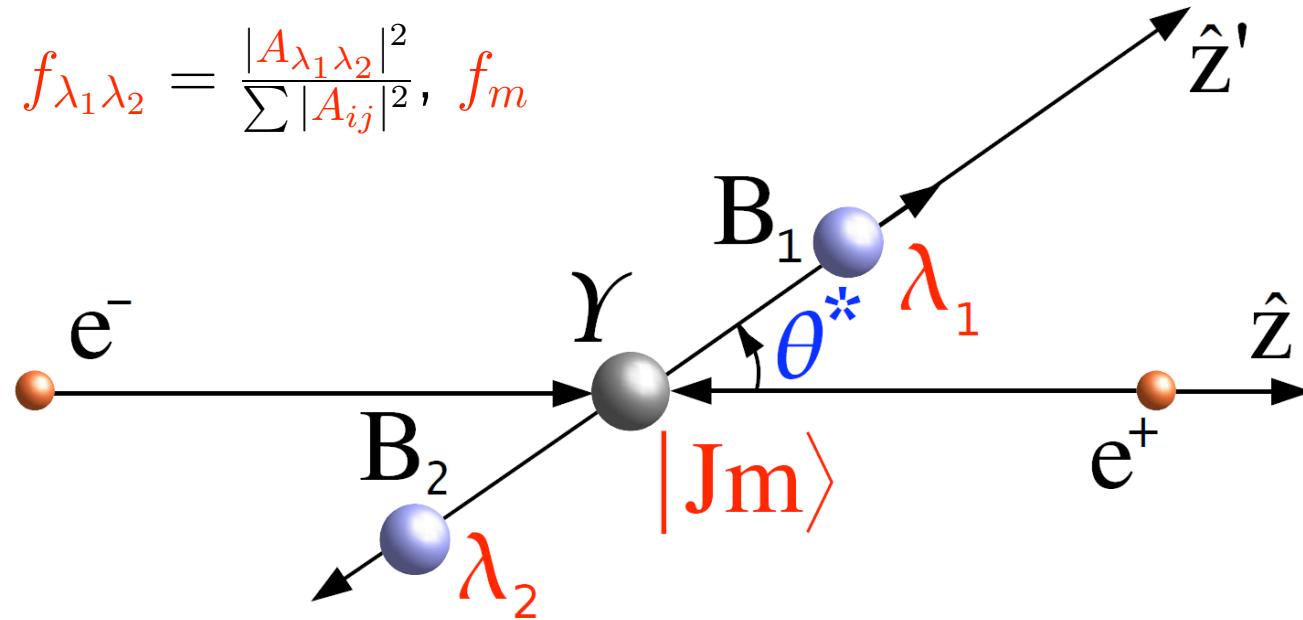

$e^+e^- \rightarrow \Upsilon(4S) \rightarrow B\bar{B}$ at SLAC

Kinematics in Production

- Angular distribution of $X \rightarrow P_1 P_2$

fractions $f_{\lambda_1 \lambda_2} = \frac{|A_{\lambda_1 \lambda_2}|^2}{\sum |A_{ij}|^2}$, f_m

$$\frac{d\Gamma(X_J \rightarrow P_1 P_2)}{\Gamma d \cos \theta^*} = \left(J + \frac{1}{2} \right) \sum_{\lambda_1, \lambda_2} f_{\lambda_1 \lambda_2} \sum_m f_m |d_{m, \lambda_1 - \lambda_2}^J(\theta^*)|^2$$

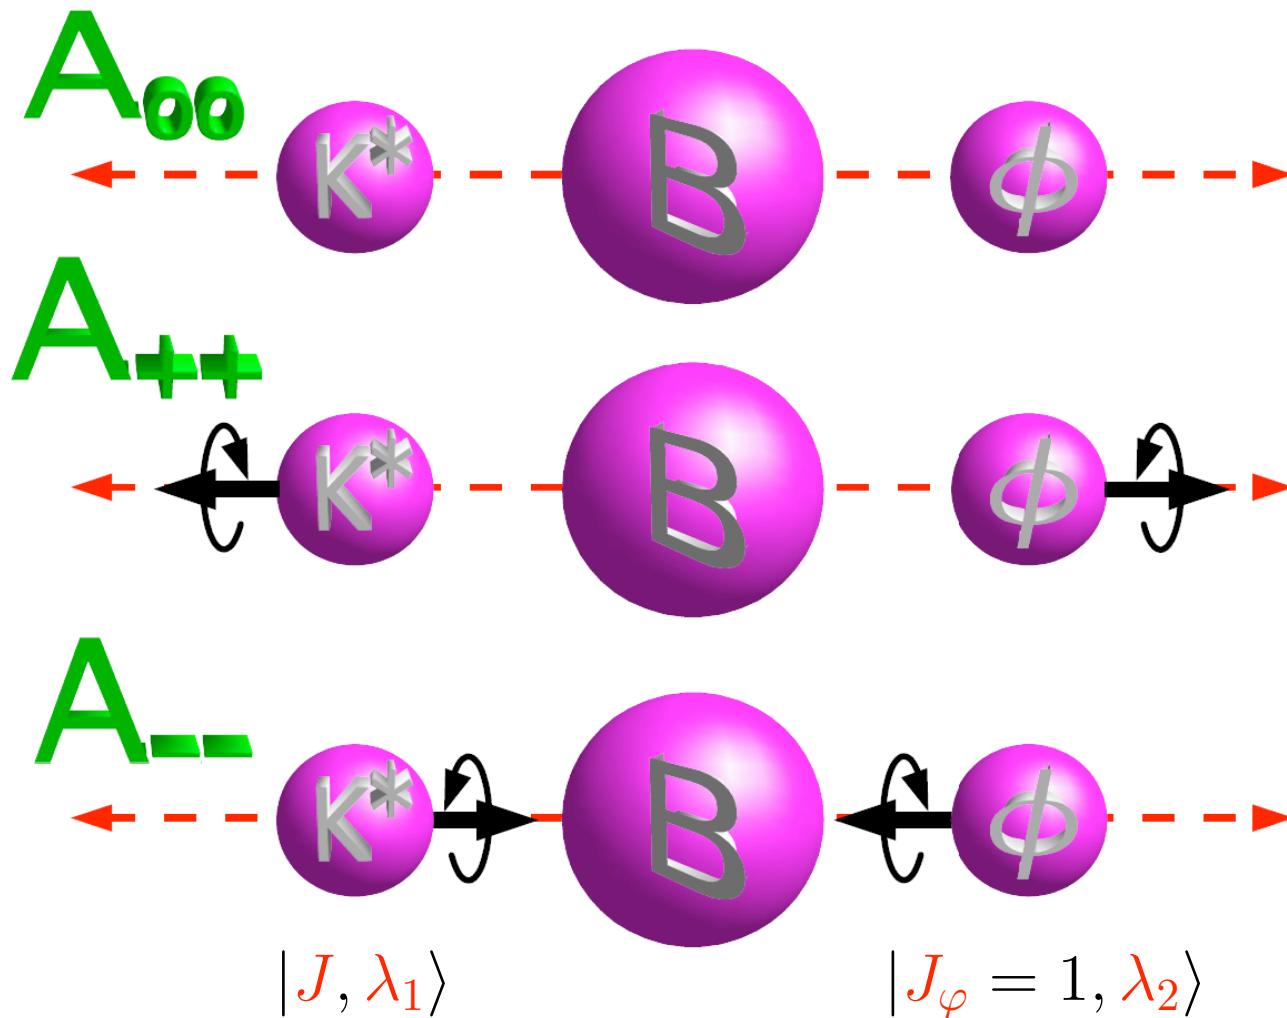

- For $\gamma \rightarrow B\bar{B}$:
 $\lambda_1 = \lambda_2 = 0$, $J = 1$, $m = \pm 1$

$$\frac{d\Gamma(\gamma \rightarrow B\bar{B})}{\Gamma d \cos \theta^*} \propto |d_{1,0}^1(\theta^*)|^2 \propto \sin^2 \theta^*$$

Polarization Experiment with $B \rightarrow VV(T)$

- 3 spin configurations \Rightarrow 3 amplitudes $A_{\lambda_1\lambda_2}$ (similar to $H \rightarrow ZZ\dots$)

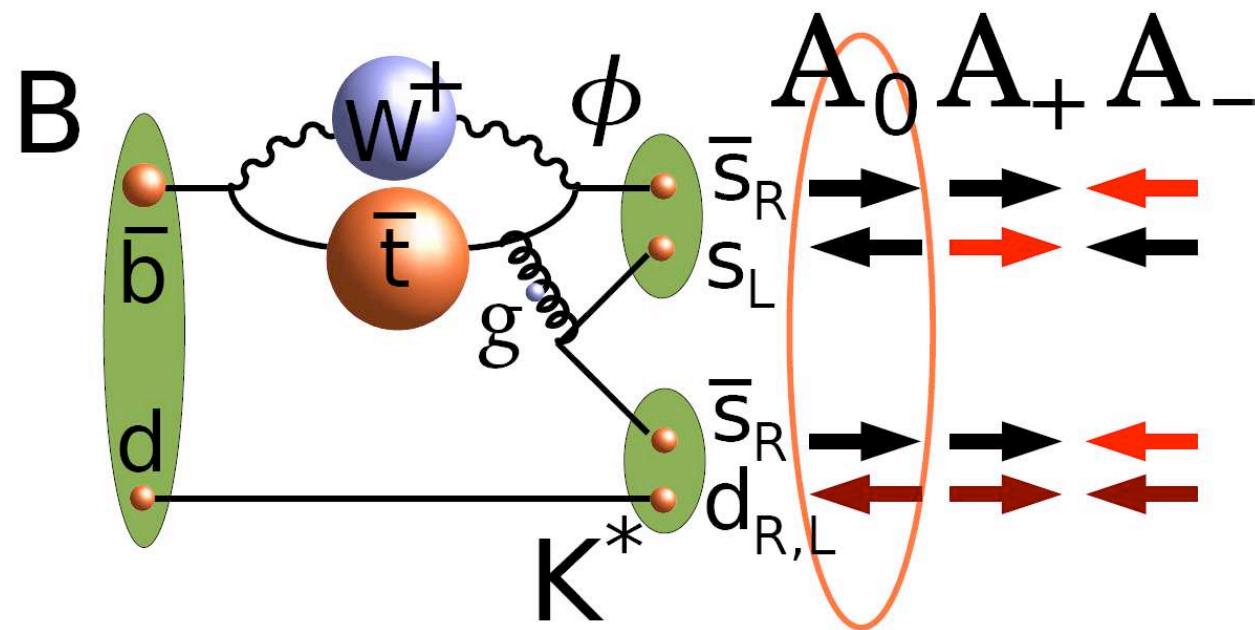

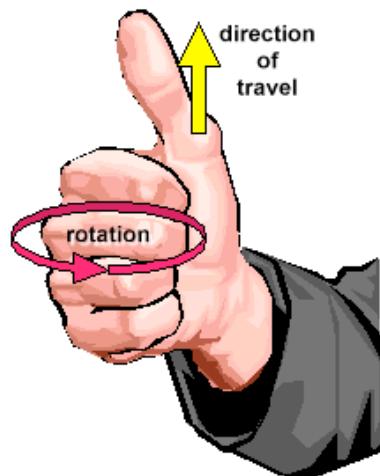

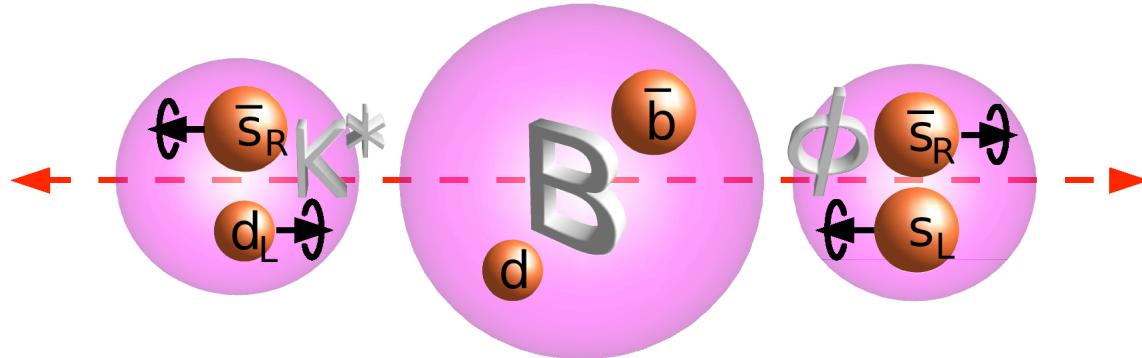

$$|J_B, m\rangle = |0, 0\rangle \Rightarrow \lambda_1 = \lambda_2$$

- Try $K_J^{(*)} \rightarrow K\pi(\pi)$ with $J^P = 0^+, 0^-, 1^+, 1^-, 2^+, 2^-, 3^-, 4^+, \dots$

Polarization in B Decays

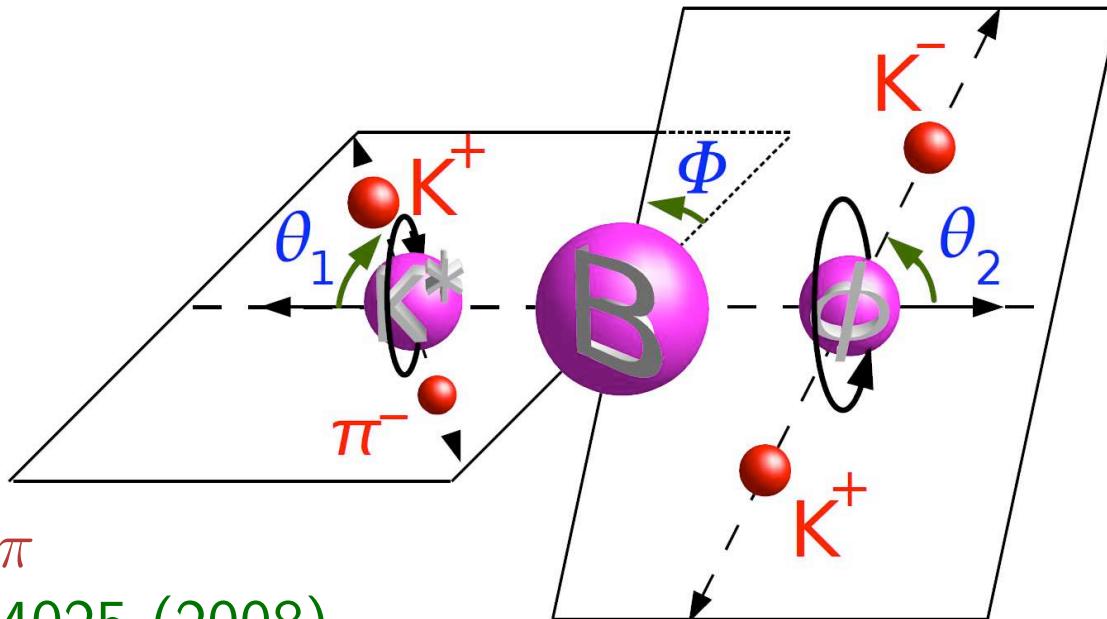

- “penguin” $B \rightarrow \varphi K^*$ with vector (tensor) mesons
polarization puzzle *BABAR* arXiv:hep-ex/0303020; *BELLE* arXiv:hep-ex/0307014

$$|A_{00}|^2 \gg |A_{++}|^2 \gg |A_{--}|^2 \quad \text{suppression} \sim (m_\varphi/m_B)^2 \sim 1/25$$

Angular Measurements

- For $K^* \rightarrow K\pi$:

- For $K_J^{(*)} \rightarrow K\pi\pi$

see PRD 77, 114025 (2008)

$$\frac{d^3\Gamma}{d\cos\theta_1 d\cos\theta_2 d\Phi} \propto \left| \sum_J \sum_{\lambda=\pm,0} A_{\lambda\lambda}^J \times Y_J^\lambda(\theta_1, \Phi) \times Y_1^{-\lambda}(\pi - \theta_2, 0) \right|^2$$

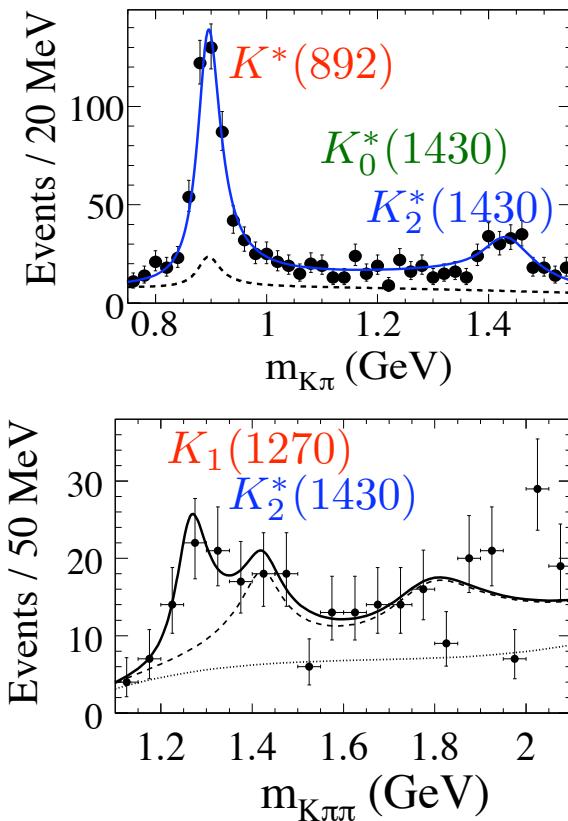

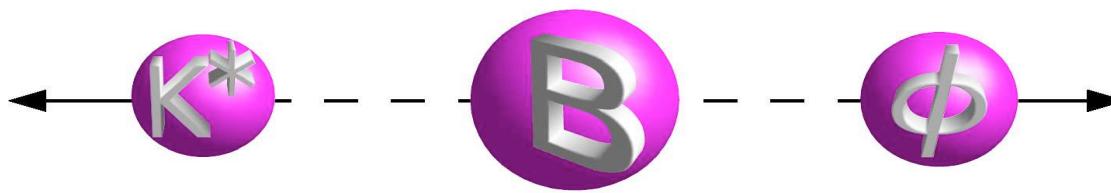

$$d\Gamma_{J=1} \propto \left\{ \begin{array}{l} \frac{1}{4} \text{transverse} \\ \sin^2 \theta_1 \sin^2 \theta_2 (|A_{++}|^2 + |A_{--}|^2) \end{array} \right. + \left. \begin{array}{l} \text{longitudinal} \\ \cos^2 \theta_1 \cos^2 \theta_2 |A_{00}|^2 \end{array} \right.$$

$$+ \frac{1}{2} \sin^2 \theta_1 \sin^2 \theta_2 [\cos 2\Phi \operatorname{Re}(A_{++} A_{--}^*) - \sin 2\Phi \operatorname{Im}(A_{++} A_{--}^*)] \\ + \frac{1}{4} \sin 2\theta_1 \sin 2\theta_2 [\cos \Phi \operatorname{Re}(A_{++} A_{00}^* + A_{--} A_{00}^*) - \sin \Phi \operatorname{Im}(A_{++} A_{00}^* - A_{--} A_{00}^*)] \right\}$$

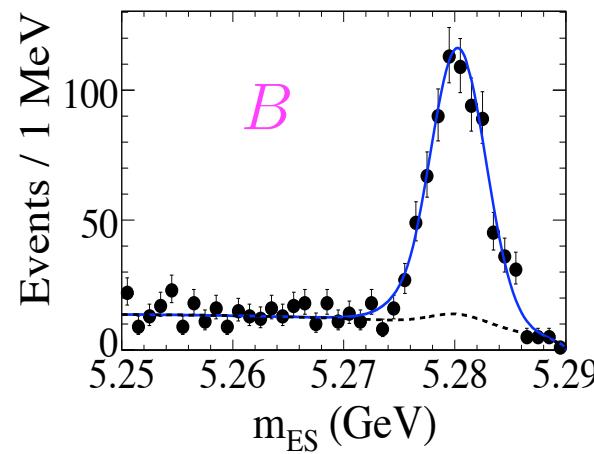

Polarization in $B \rightarrow \varphi K_J^{(*)}$ Decays

- Complex multivariate analysis with 12 parameters per channel

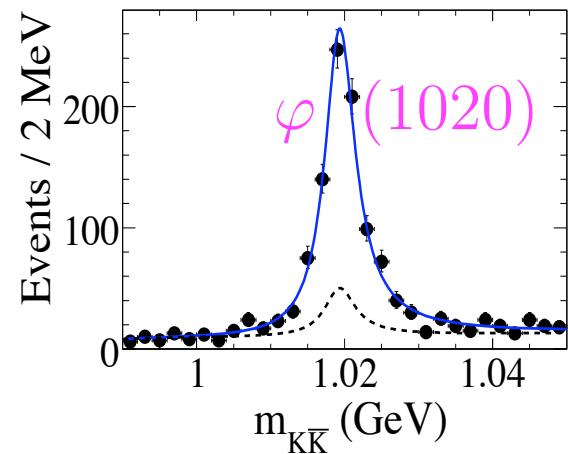

B (matter): $|A_{00}|, |A_{++}|, |A_{--}|, \arg(A_{00}), \arg(A_{++}), \arg(A_{--})$
 \bar{B} (antimatter): $|\bar{A}_{00}|, |\bar{A}_{++}|, |\bar{A}_{--}|, \arg(\bar{A}_{00}), \arg(\bar{A}_{++}), \arg(\bar{A}_{--})$

BABAR PRD78,092008(2008)

BABAR PRL101,161801(2008)

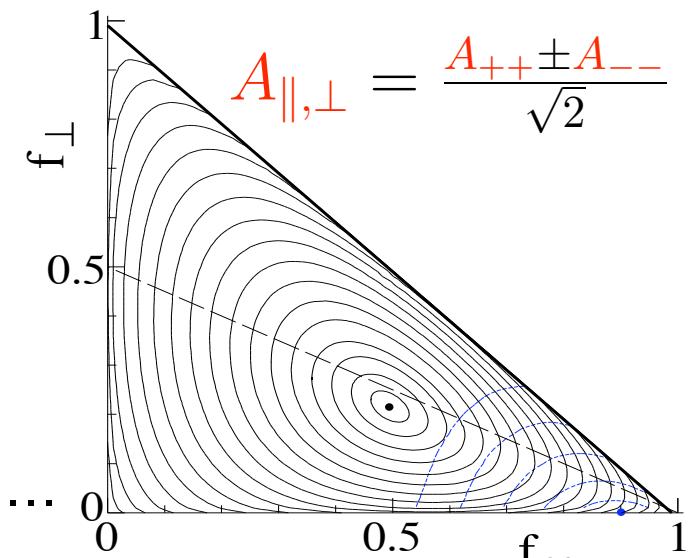

Polarization in $B \rightarrow \varphi K_J^{(*)}$ Decays

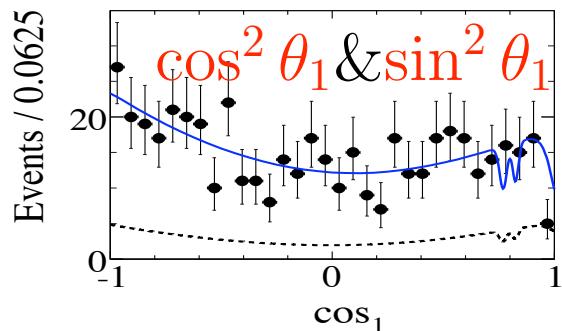

- Puzzle $J = 1$, not 2: $|A_{00}|^2 \simeq |A_{++}|^2 \gg |A_{--}|^2$; $\arg(\frac{A_{00}}{A_{++}}) \neq 0, \pi$

<i>BABAR</i>	J^P	$f_{00} = \frac{ A_{00} ^2}{\sum A_{\lambda\lambda} ^2}$
$B \rightarrow \varphi K^*(892)^0$	1^-	$0.494 \pm 0.034 \pm 0.013$
$B \rightarrow \varphi K^*(892)^+$	1^-	$0.49 \pm 0.05 \pm 0.03$
$B \rightarrow \varphi K_1(1270)^+$	1^+	$0.46^{+0.12}_{-0.13} {}^{+0.03}_{-0.07}$
$B \rightarrow \varphi K_2^*(1430)^0$	2^+	$0.901^{+0.046}_{-0.058} \pm 0.037$
$B \rightarrow \varphi K_2^*(1430)^+$	2^+	$0.80^{+0.09}_{-0.10} \pm 0.03$

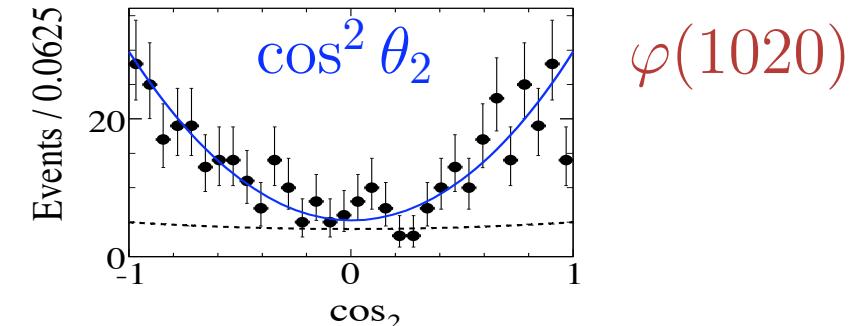

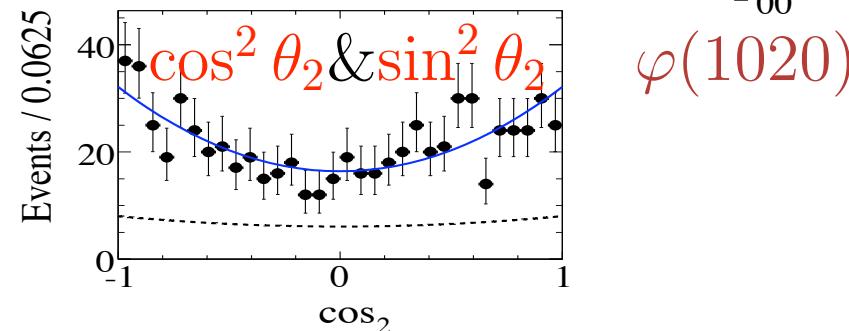

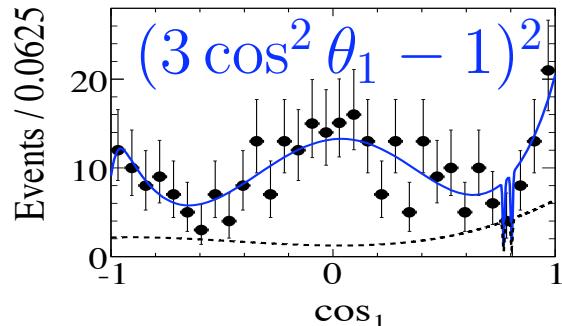

looked for $K_J^{(*)}$ with 2^- , 3^- , 4^+ , none found...

$K^*(892)$

$K_2^*(1430)$
 $K_0^*(1430)$

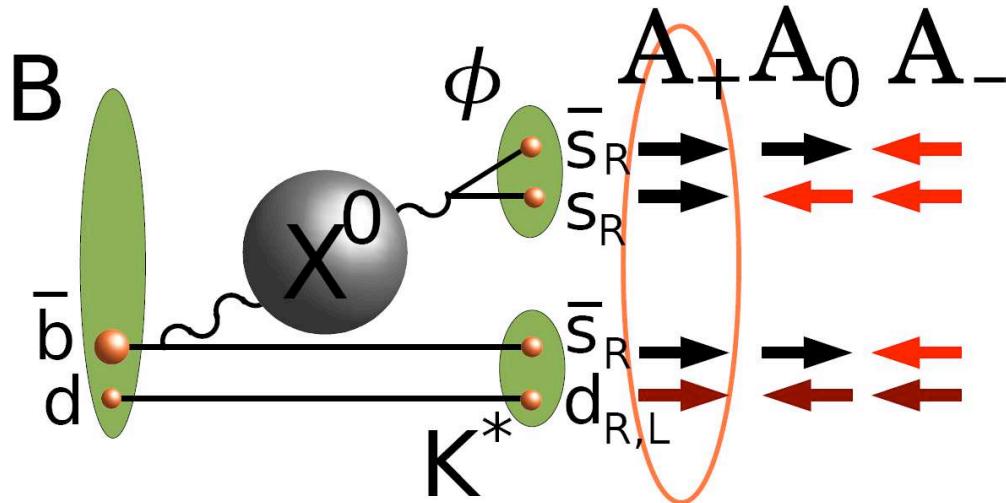

New Physics in B Decay Polarization

scalar (tensor) interaction

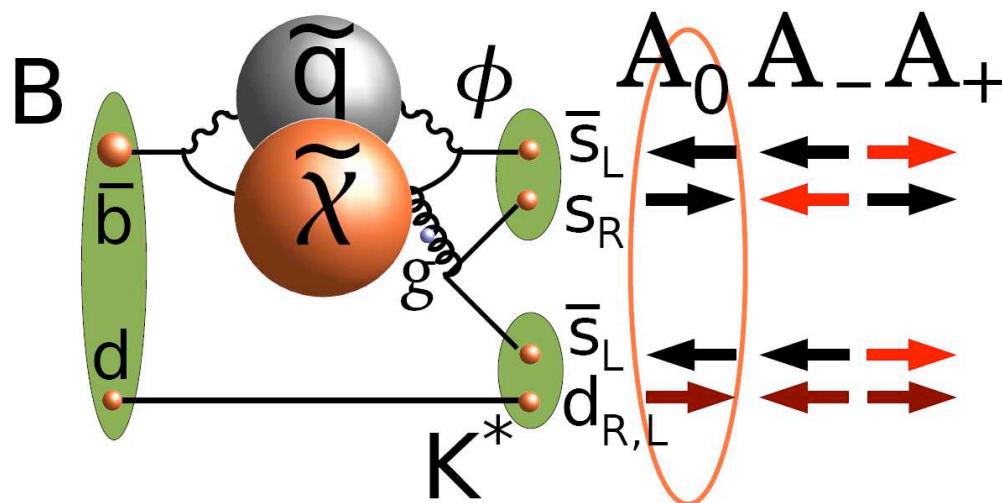

violate $|A_{00}|^2 \gg |A_{++}|^2 \gg |A_{--}|^2$

SM: $\bar{q}\gamma^\mu(1 - \gamma^5)q$

$|A_{++}|^2 \gg |A_{00}|^2 \gg |A_{--}|^2$
 $\bar{q}(1 + \gamma^5)q$

supersymmetry

$|A_{00}|^2 \gg |A_{--}|^2 \gg |A_{++}|^2$
 $\bar{q}\gamma^\mu(1 + \gamma^5)q$

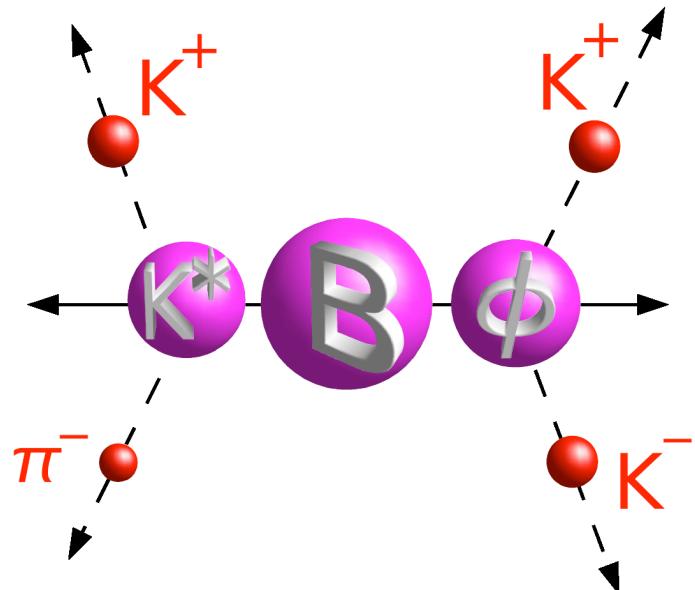

QCD rescattering,
penguin annihilation ???
no satisfactory solution...

What we have learned

from B decays:

- power of spin correlations
- extract maximum information
- production and decay angular formalism
- surprises (either within or beyond SM)
- better to look for beyond SM in direct production

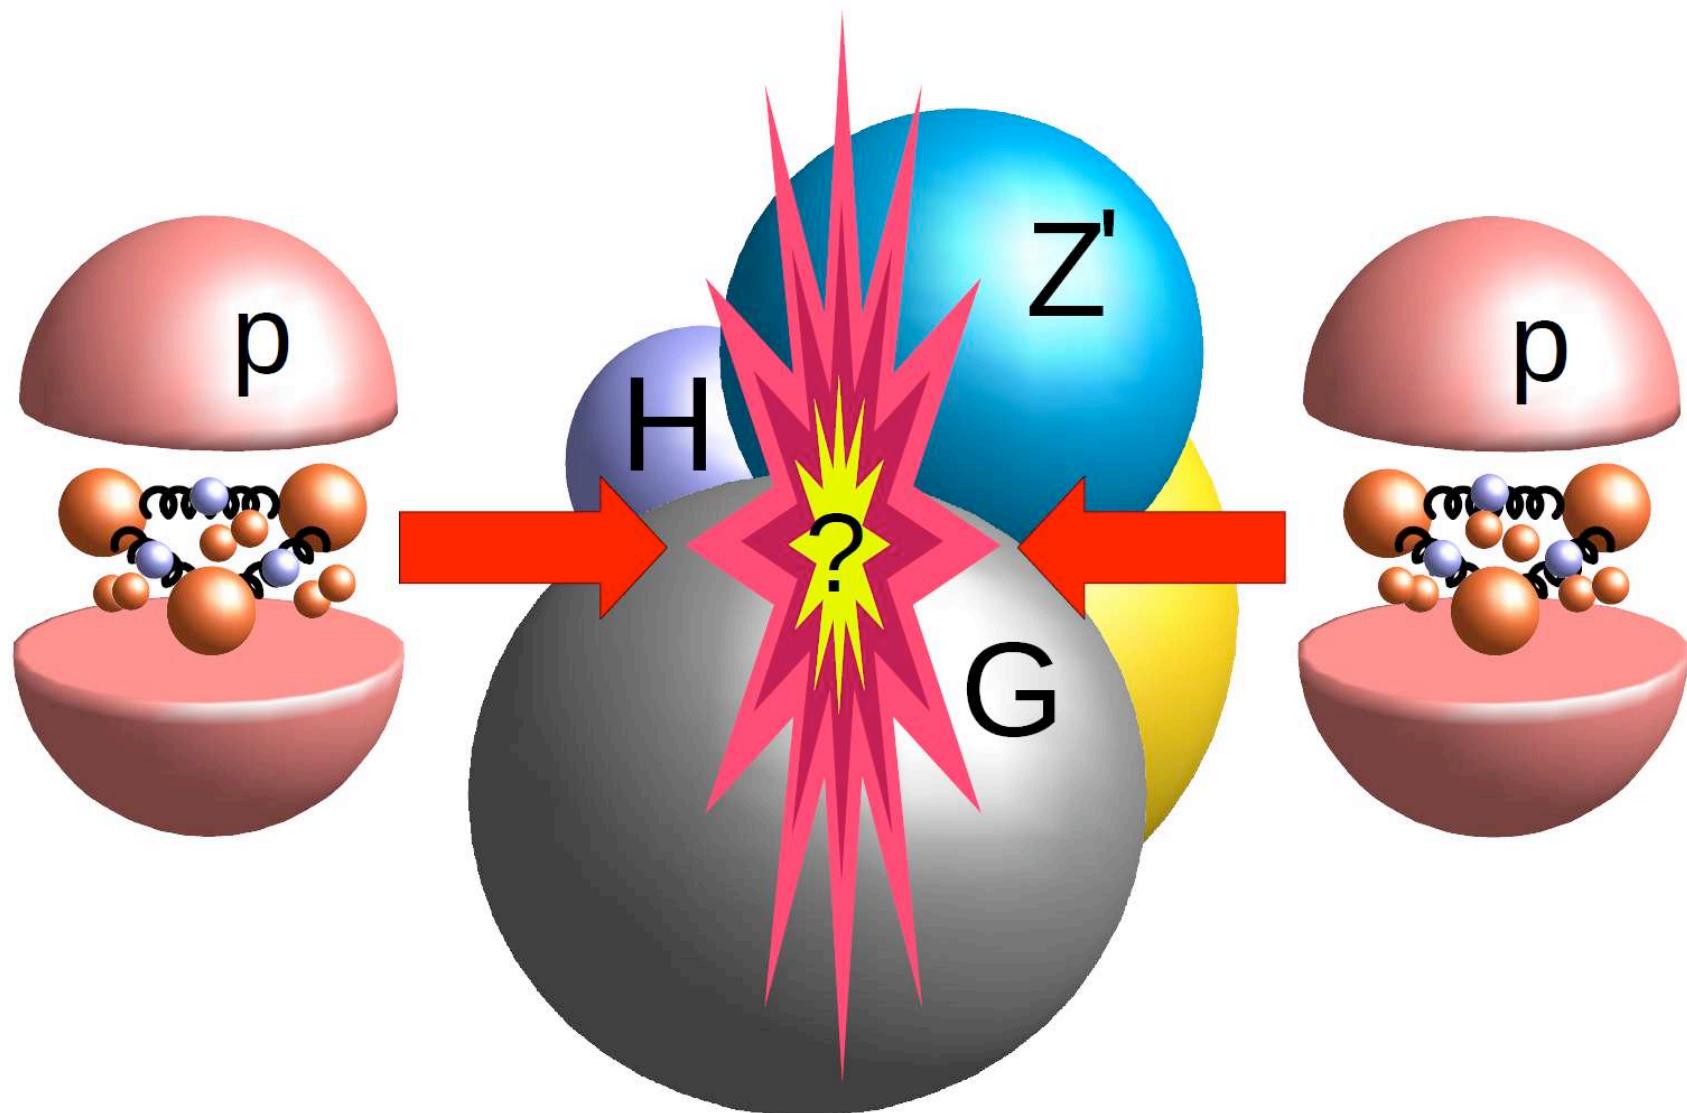

if energy reachable \Rightarrow move to LHC

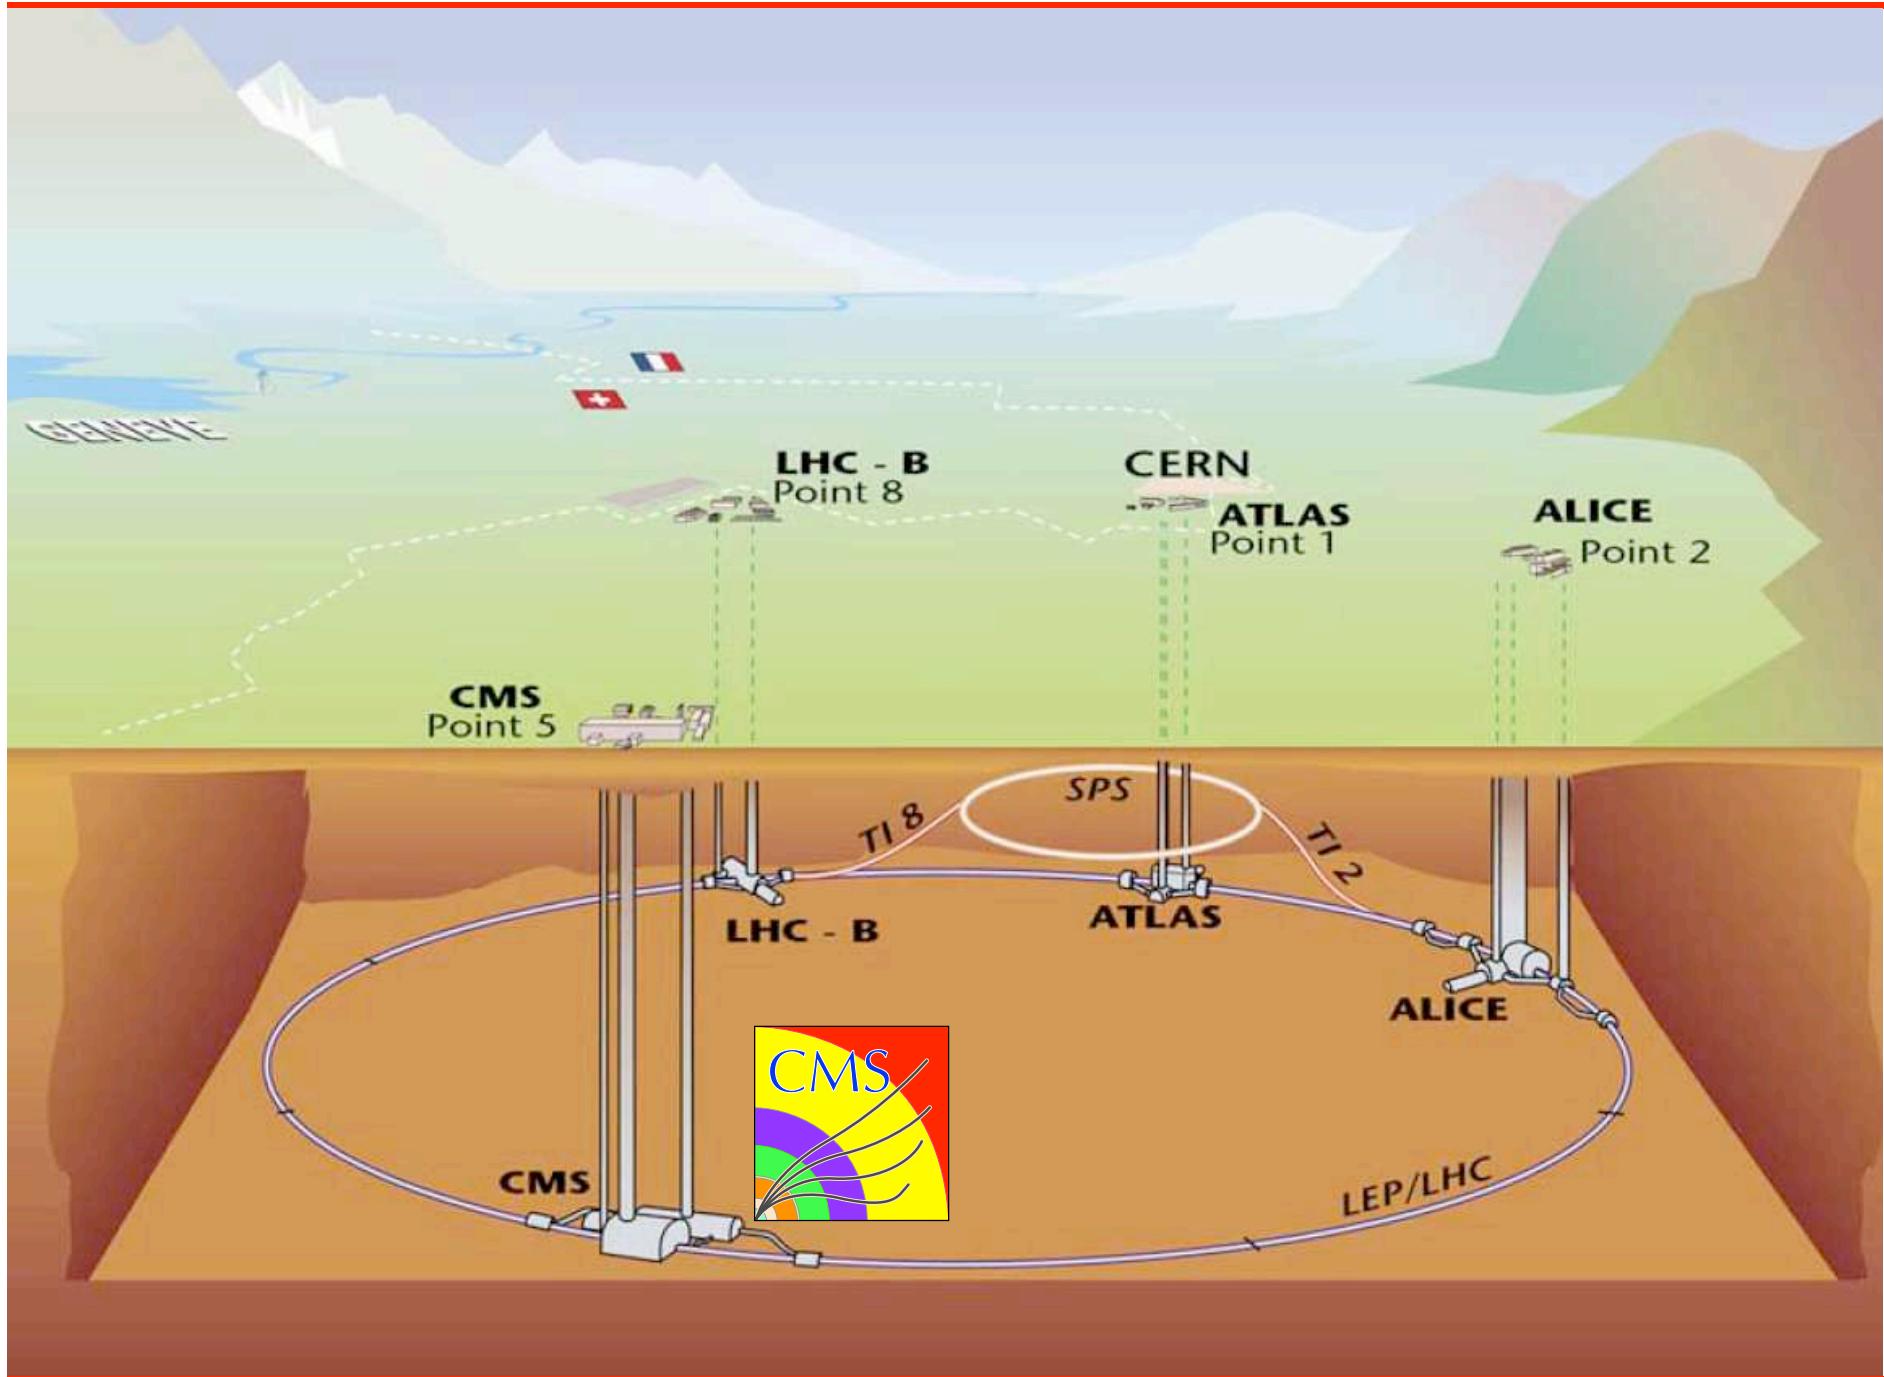

Production and decay of **new resonances** at hadron colliders

Production of New Resonances

- Large Hadron Collider is a discovery machine

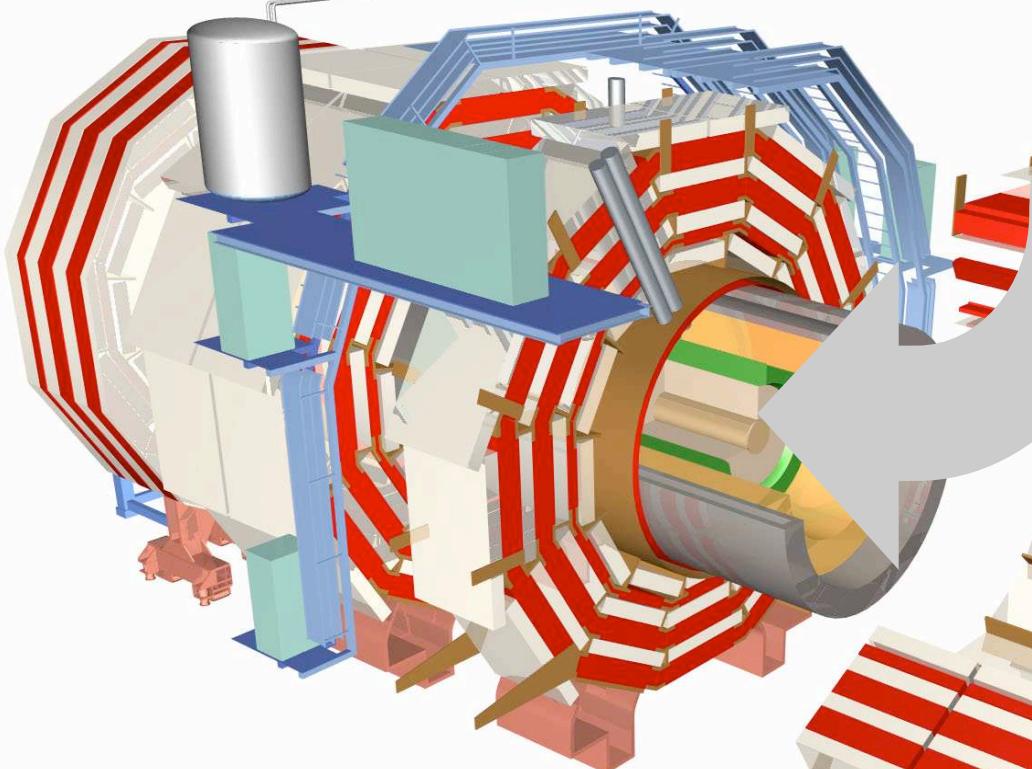

Large Hadron Collider: starting now

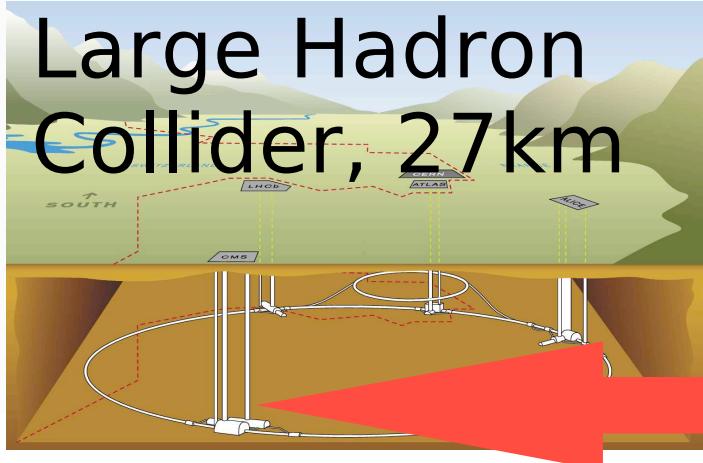

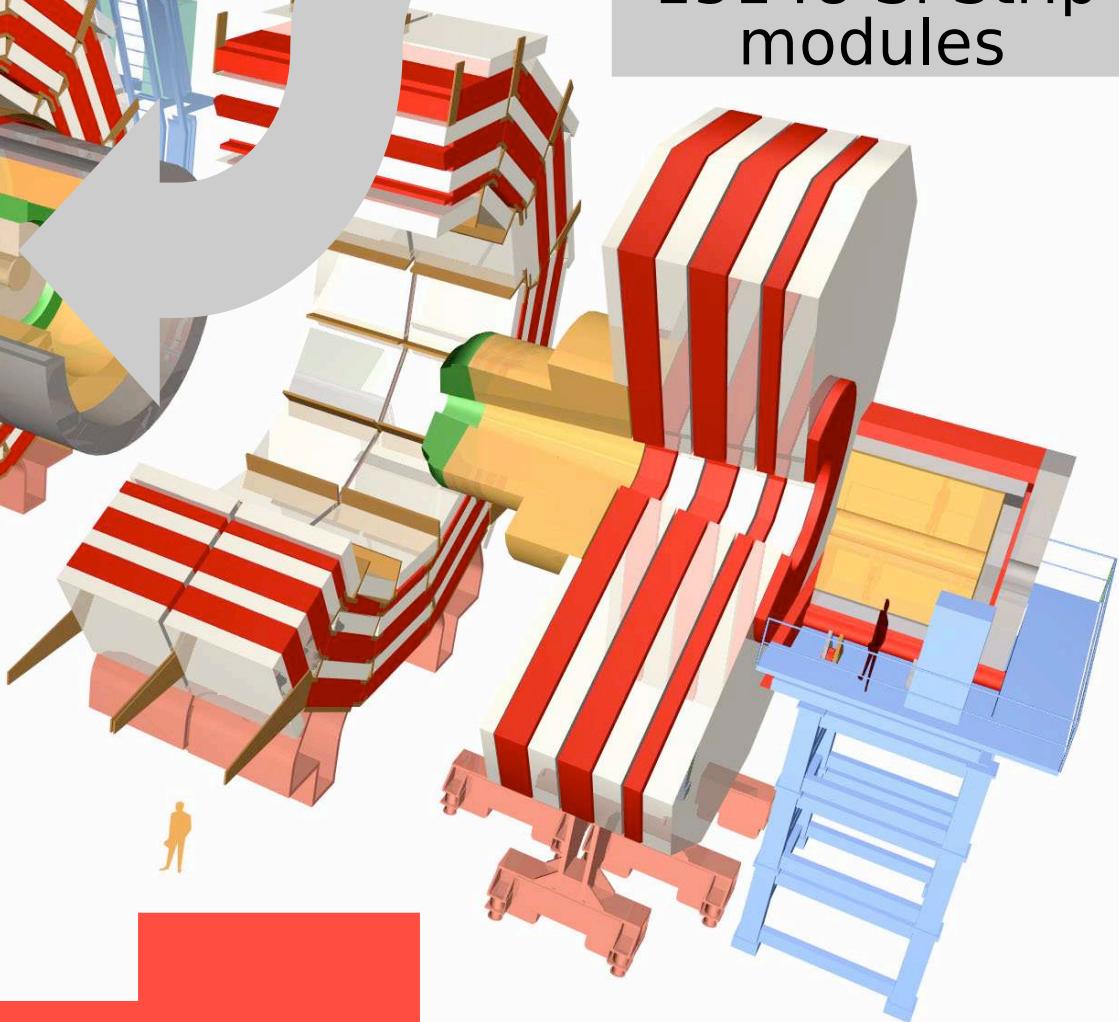

Example: Tracker in the CMS Detector

CMS Detector at LHC

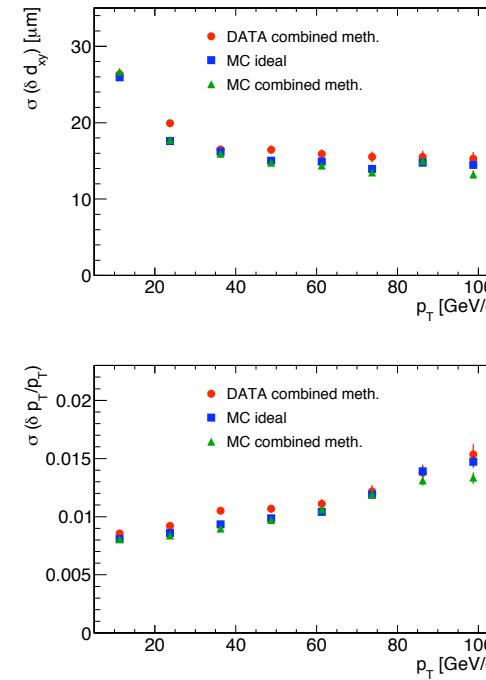

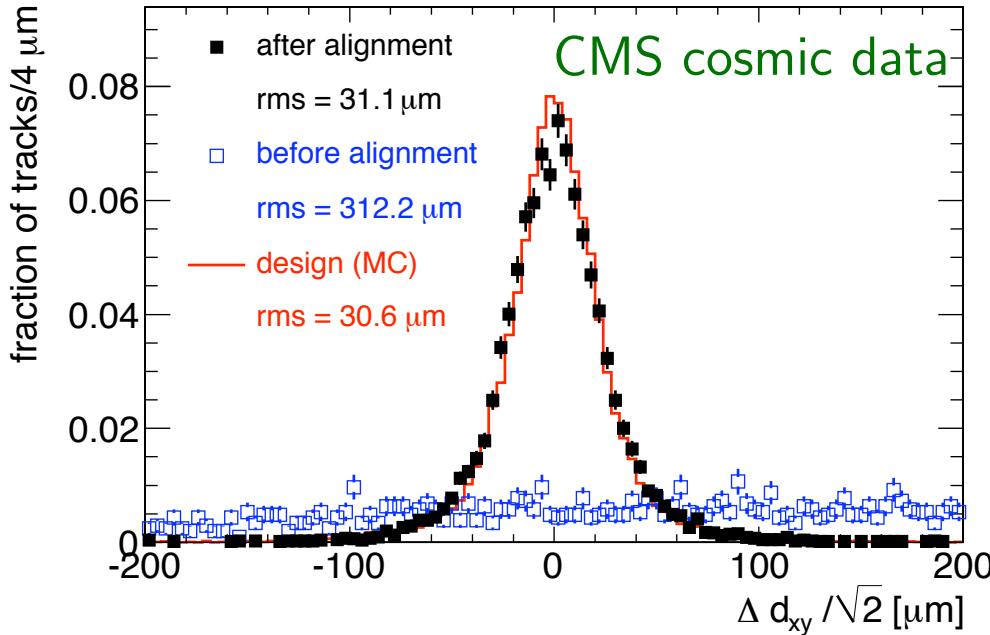

CMS Tracker
1440 Si Pixel
15148 Si Strip
modules

CMS Tracker Performance

- Excellent performance; use parameterization for studies in this talk:

- First paper signed by CMS collaboration (2443 authors), in JINST:

Alignment of the CMS Silicon Tracker during
Commissioning with Cosmic Rays
arXiv:0910.2505v2 [physics.ins-det] 22 Nov 2009

The CMS Collaboration*

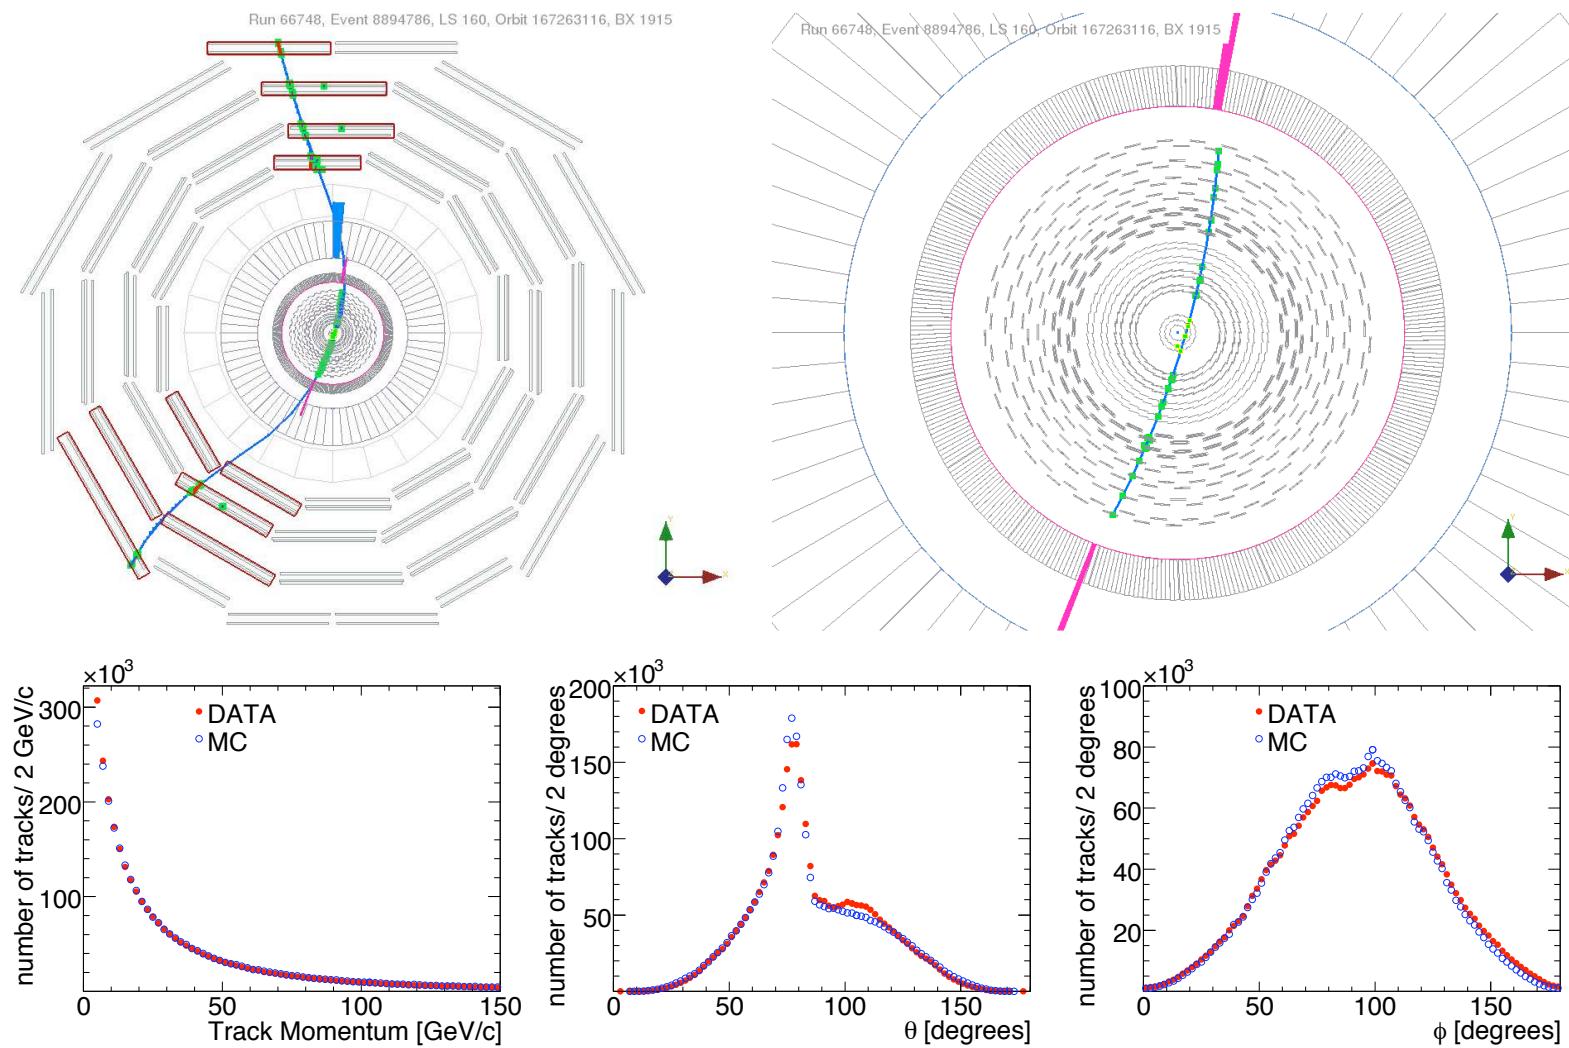

*See Appendix A for the list of collaboration members

- CMS Times in March (article “Alignment of a Giant”):

http://cms.web.cern.ch/cms/Media/Publications/CMSTimes/2010/03_01/

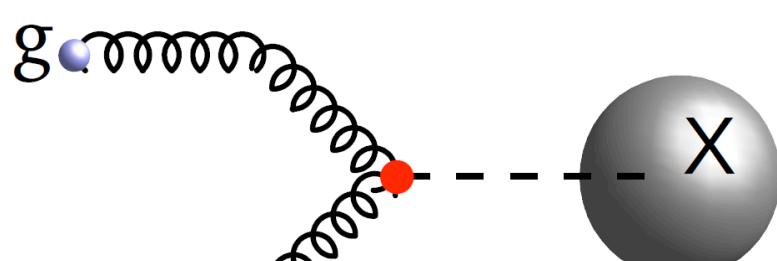

CMS Readiness

- Imagine $Z' \rightarrow \mu^+ \mu^-$
 - may look the same as one cosmic μ^+
 - CMS has been collecting **cosmic** data in 2007-2010

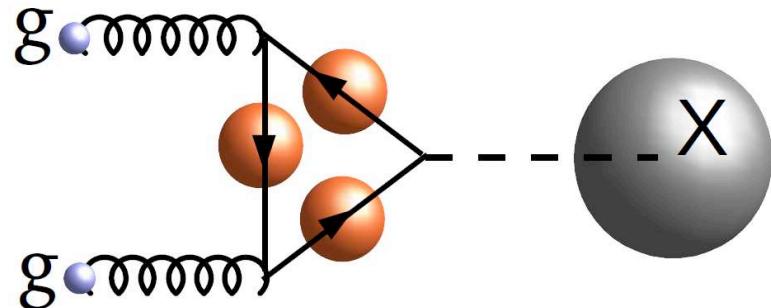

Production of New Resonances

- Consider two dominant production mechanisms

of color-neutral
& charge-neutral X

- Gluon fusion $gg \rightarrow X$

$$J = 0 \text{ or } 2$$

$$J_z = 0 \text{ or } \pm 2$$

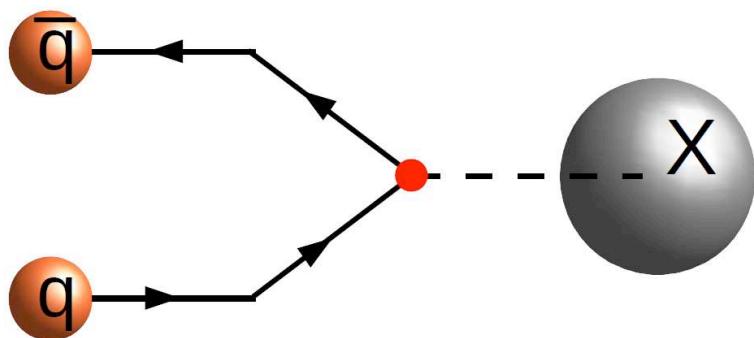

expect to dominate at lower mass

- Quark-antiquark $q\bar{q} \rightarrow X$

$$J = 1 \text{ or } 2$$

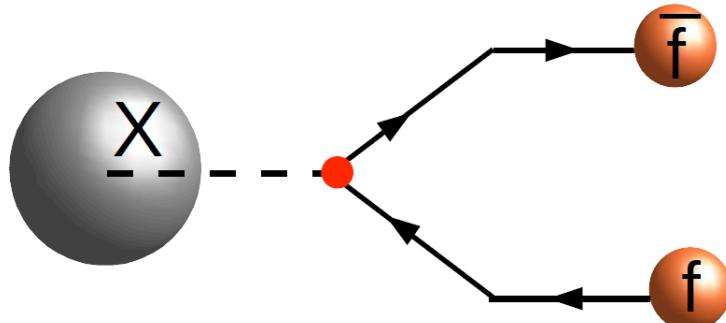

$$J_z = \pm 1 \quad (m_q \rightarrow 0)$$

assume chiral symmetry is exact

Decay of New Resonances

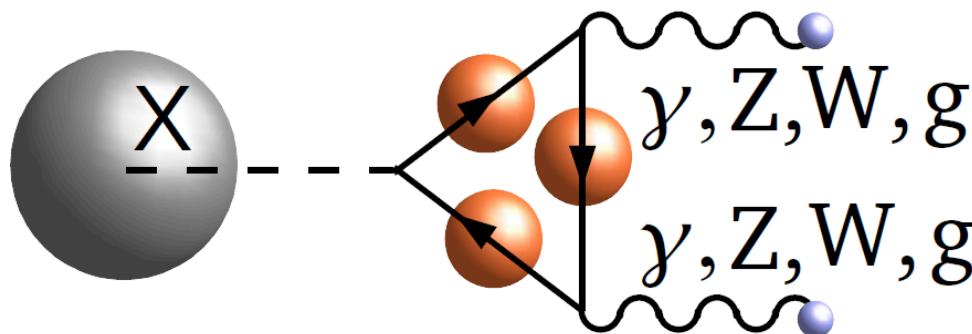

- Consider decay back to Standard Model particles

- Decay to fermions

$$X \rightarrow l^+l^-, q\bar{q}$$

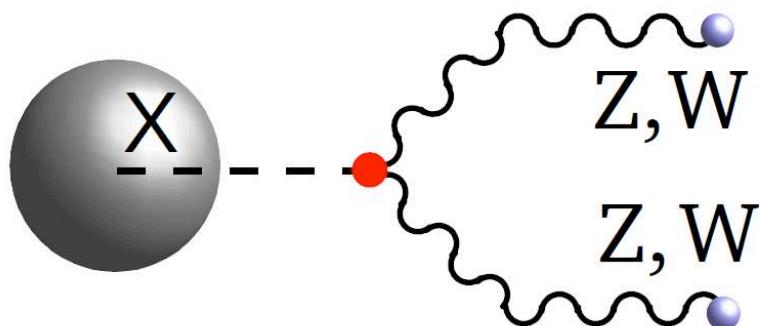

spin-0 excluded $m_f \rightarrow 0$

- Decay to gauge bosons

$$X \rightarrow \gamma\gamma, W^+W^-$$

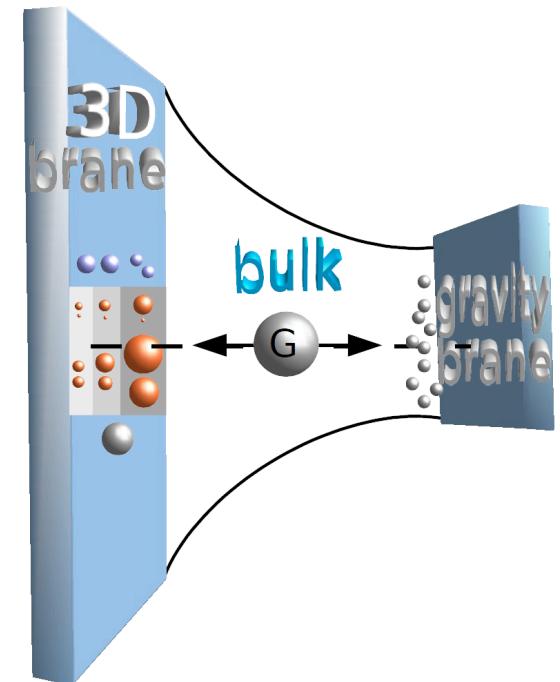

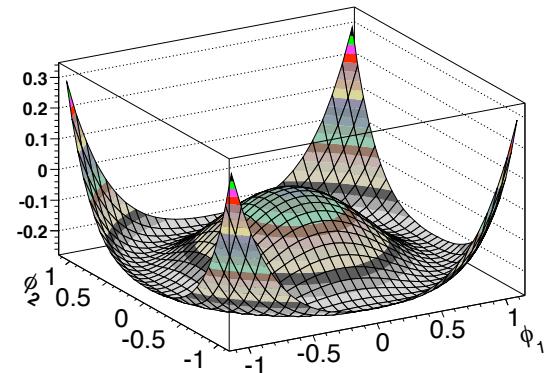

spin-1 excluded with $\gamma\gamma, gg$

again X is color-neutral
& charge-neutral

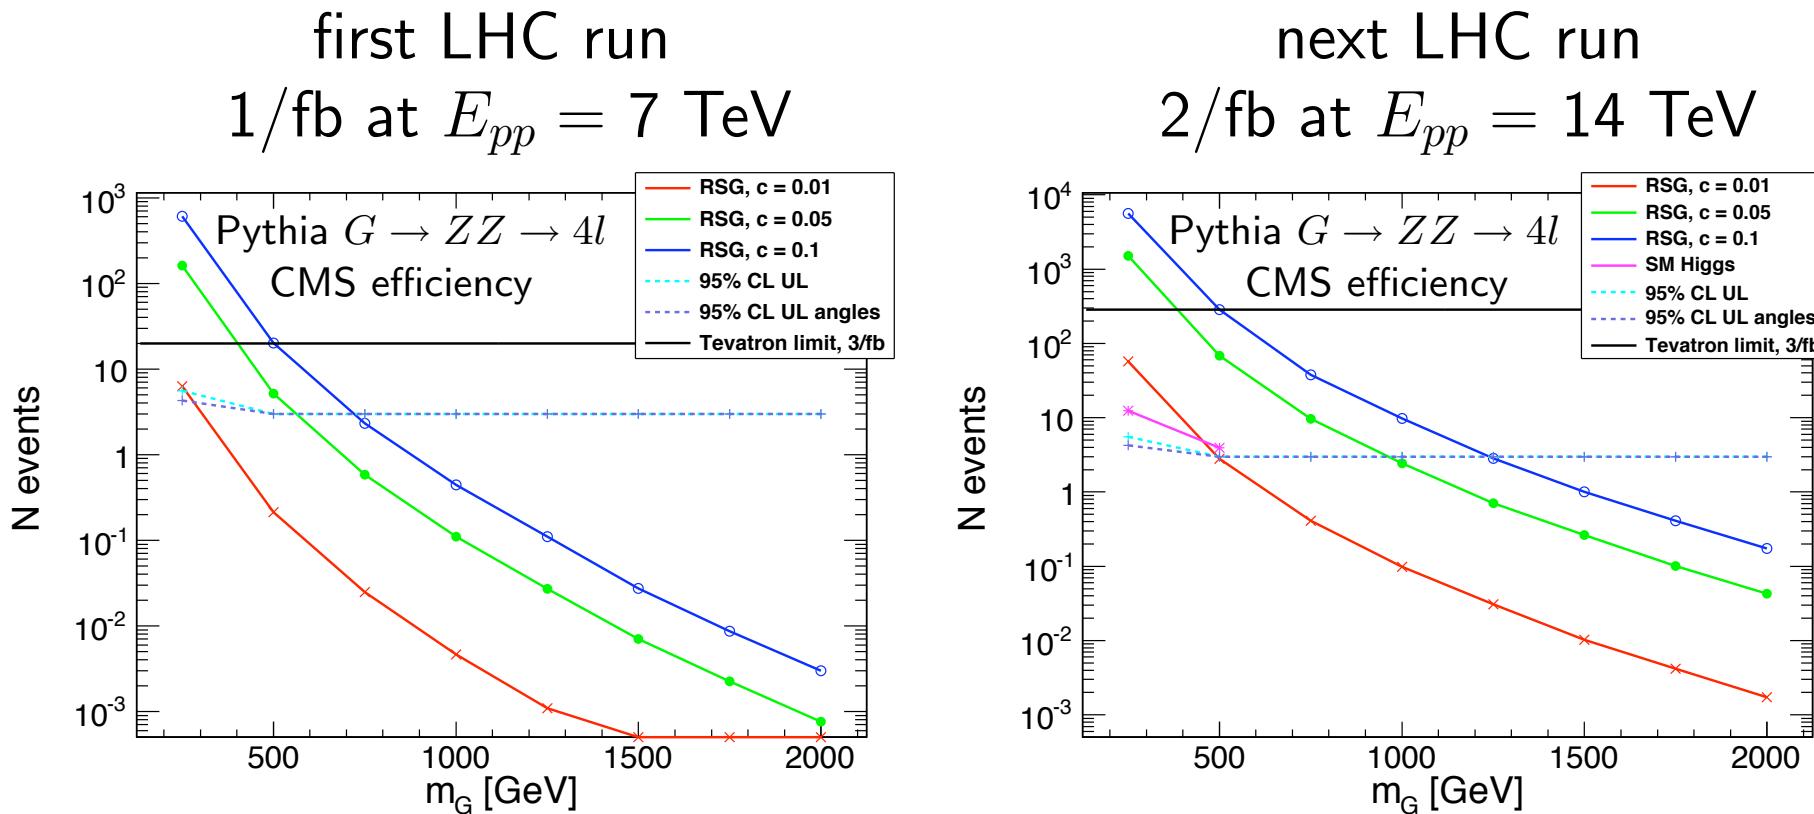

Do we expect such new resonances?

- Spin=0 (Higgs)
 - $J^P = 0^+$ SM $H \rightarrow \gamma\gamma, W^+W^-, ZZ, b\bar{b}, t\bar{t}$
 - $J^P = 0^-$ A multi-Higgs models
- Spin=1 (new gauge boson)
 - KK boson, $Z' \rightarrow l^+l^-$, $q\bar{q}$ dominant
 - plausible models when ZZ and WW dominate (“heavy photon”)
- Spin=2 (“graviton”)
 - RS Graviton 2^+ (minimal) \Leftrightarrow extra dim.
SM on TeV brane, G_{RS} near TeV brane
 $G_{RS} \rightarrow \gamma\gamma$ and l^+l^- discovery, flavor problem
 - RS G 2^+ (non-min.), light fermions in bulk
(K.Agashe et al., hep-ph/0701186)
 $G_{RS} \rightarrow W_L^+W_L^-$ and Z_LZ_L dominate

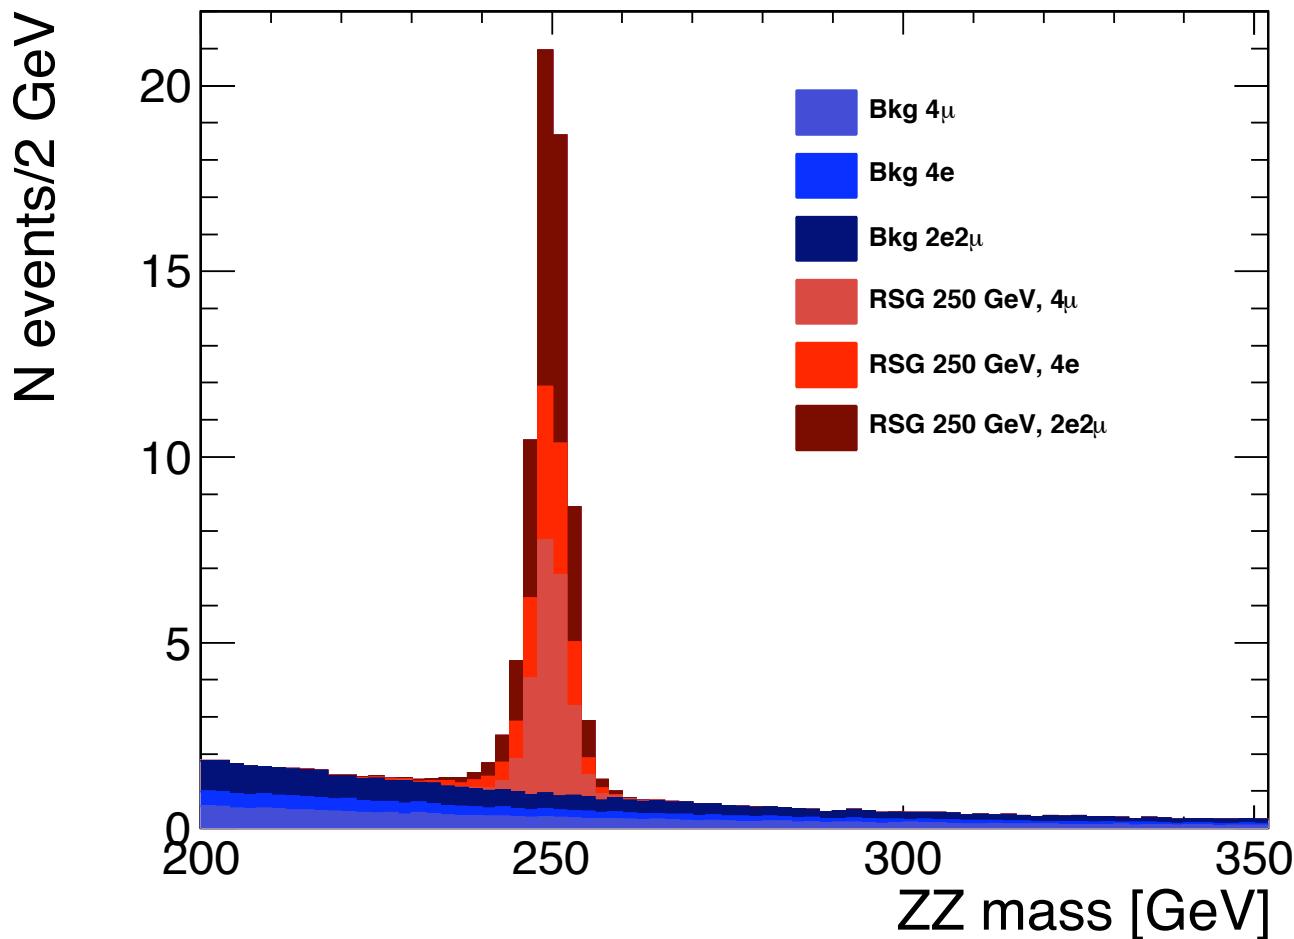

Example of $G_{\text{RS}} \rightarrow ZZ \rightarrow 4l$

- RS graviton (1st excitation) **couplings** $\propto 1/\Lambda = 1/(\overline{M}_{\text{Pl}} \times e^{-kr_c\pi})$
 2 parameters: $m_G \sim \text{few} \times k \times e^{-kr_c\pi}$
 $c = k/\overline{M}_{\text{Pl}} = 0.01 - 0.1 - \sim 1$ (?)
- LHC – range of possible yields or limit tighter than Tevatron
 – at lower mass, **Higgs** and G_{RS} with $c = 0.01$ similar rate

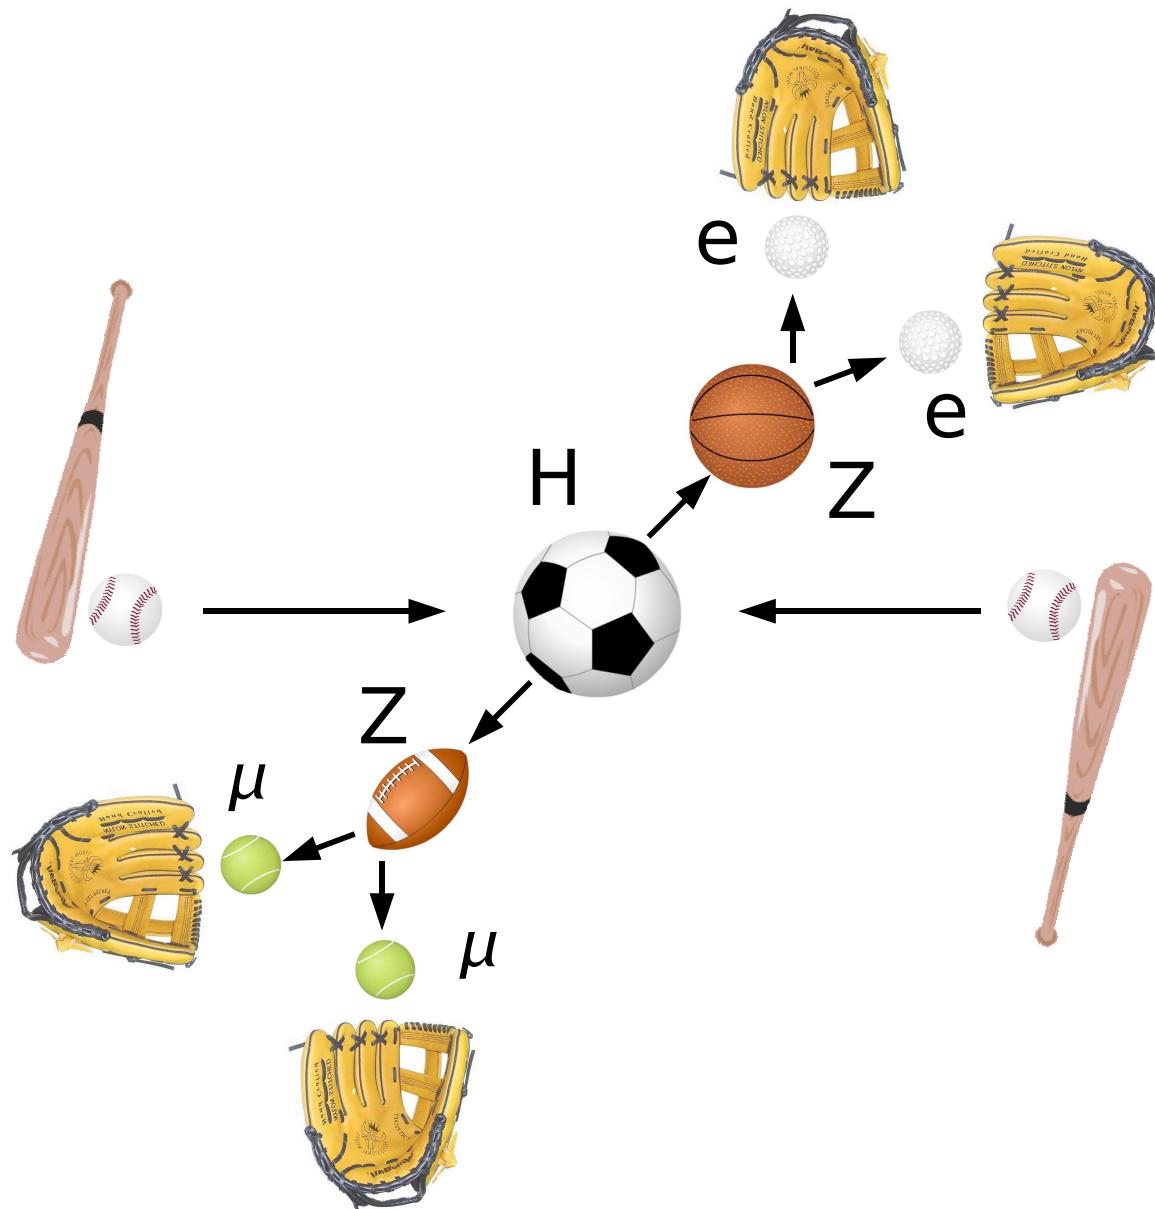

Next Steps

- Assume resonance is found \rightarrow extract maximum information
 - re-visit $X \rightarrow \gamma\gamma, l^+l^-, q\bar{q}$ (well-studied, but with min couplings)
 - concentrate on $X \rightarrow ZZ$, similar WW (a lot more to be done)
 - $X \rightarrow ZZ \rightarrow 4l$ clean example, method is general (+jet/met)

Kinematics of production and decay

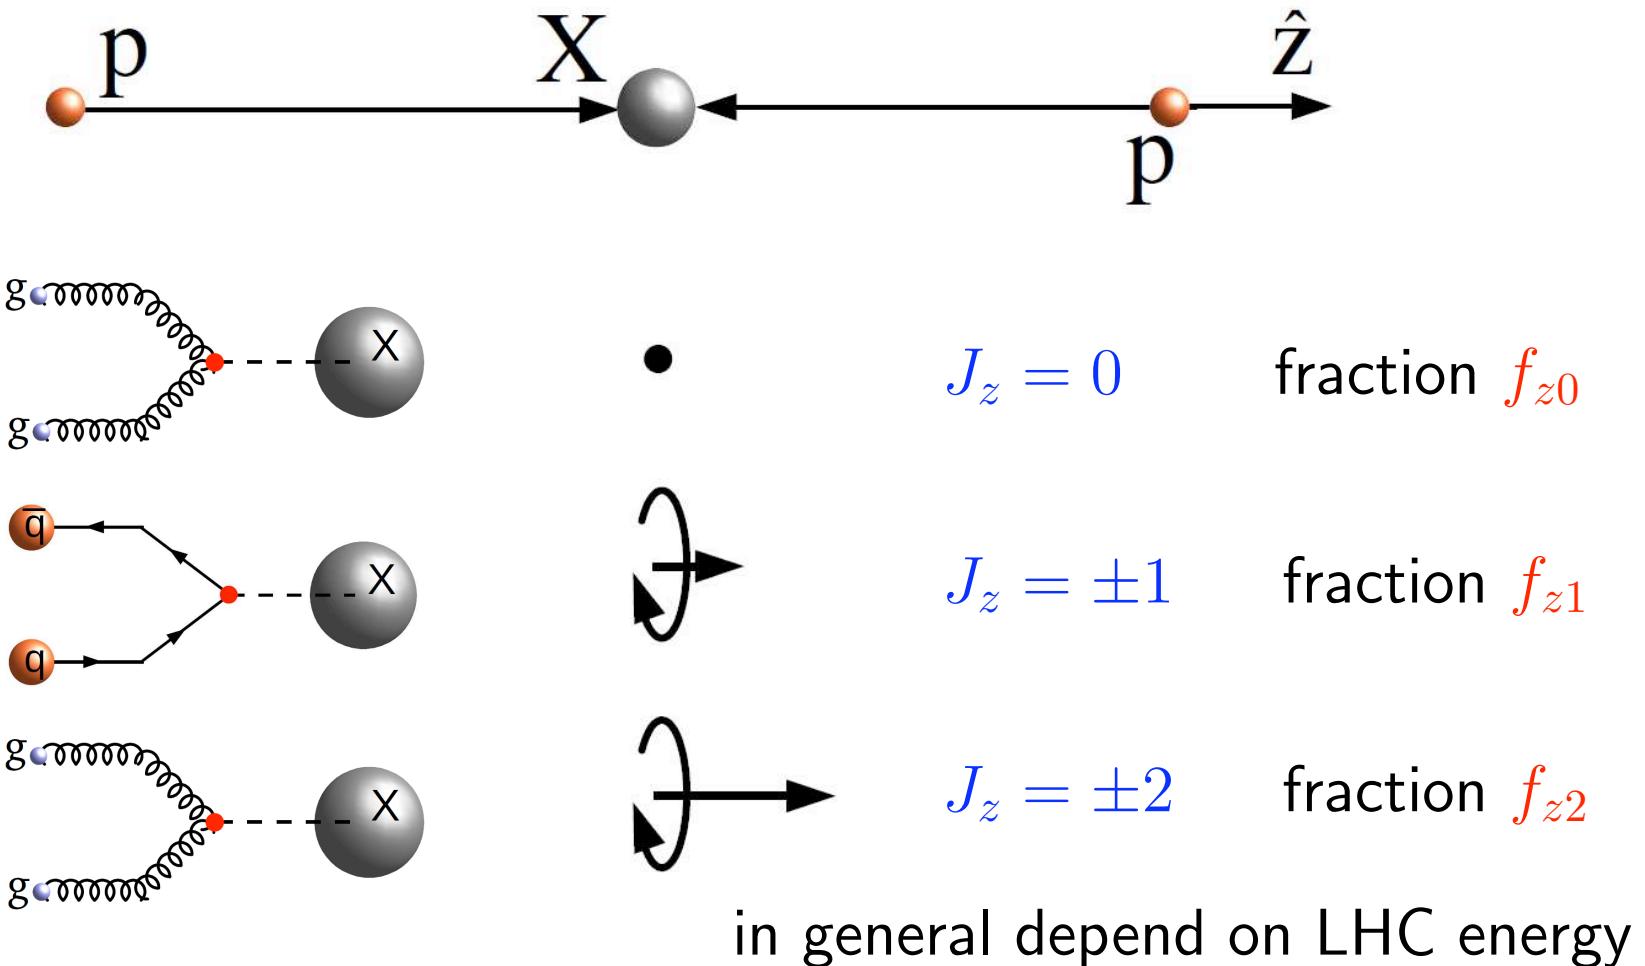

Cartoon of an Experiment

Kinematics in New Resonances Production

- $ab \rightarrow X$ polarization \Leftrightarrow production mechanism and couplings

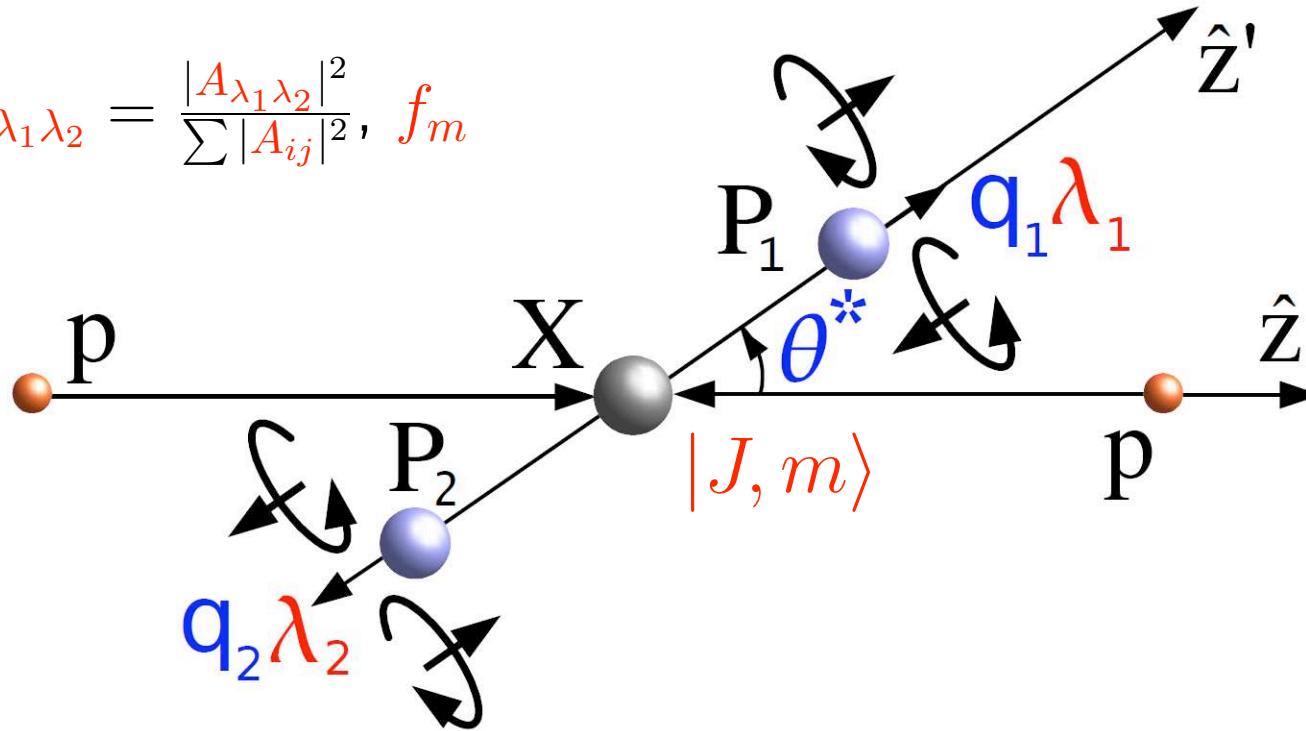

$$d\sigma_{pp}(\vec{\Omega}) = \sum_{ab} \int dY_X \, dx_1 dx_2 \, \tilde{f}_a(x_1) \, \tilde{f}_b(x_2) \, \frac{d\sigma_{ab}(x_1 p_1, x_2 p_2, \vec{\Omega})}{dY_X} \Big|_{Y_{ab}=\frac{1}{2} \ln \frac{x_1}{x_2}}$$

Kinematics in New Resonances Decay

- Only 1 angle θ^* for $X \rightarrow \gamma\gamma, l^+l^-, q\bar{q}, gg$ (but more for ZZ, WW)

fraction $f_{\lambda_1\lambda_2} = \frac{|A_{\lambda_1\lambda_2}|^2}{\sum |A_{ij}|^2}$, f_m

$$\frac{d\Gamma(X_J \rightarrow P_1 P_2)}{\Gamma d \cos \theta^*} = \left(J + \frac{1}{2} \right) \sum_{\lambda_1, \lambda_2} f_{\lambda_1 \lambda_2} \sum_m f_m (d_{m, \lambda_1 - \lambda_2}^J(\theta^*))^2$$

- Note: if $f_m = \frac{1}{J}$ $\Rightarrow \cos \theta^*$ flat \Rightarrow cannot determine spin requires f_m fine-tuning (breaks by changing LHC energy)

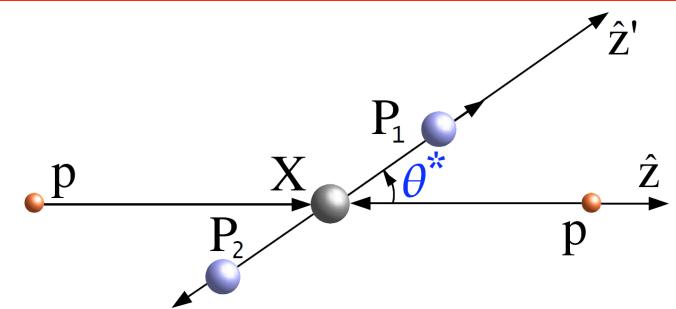

Examples

- if $X \rightarrow \gamma\gamma$ found and $\cos\theta^*$ is flat

(?) spin-0 Higgs \Leftarrow spin-1 excluded

(!) spin-2 not excluded

$\cos\theta^*$ could be flat (but not with min coupling)

$$\frac{16 d\Gamma}{5 \Gamma d \cos\theta^*} = (2 - 2f_{z1} + f_{z2}) - 6(2 - 4f_{z1} - f_{z2}) \cos^2\theta^* + 3(6 - 10f_{z1} - 5f_{z2}) \cos^4\theta^*$$

$$+ f_{+-} \left\{ (2 + 2f_{z1} - 7f_{z2}) + 6(2 - 6f_{z1} + f_{z2}) \cos^2\theta^* - 5(6 - 10f_{z1} - 5f_{z2}) \cos^4\theta^* \right\}$$

- if $X \rightarrow l^+l^-$ found and $d\Gamma \propto (1 + \cos^2\theta^*)$

(?) spin-1 Z' \Leftarrow spin-0 excluded

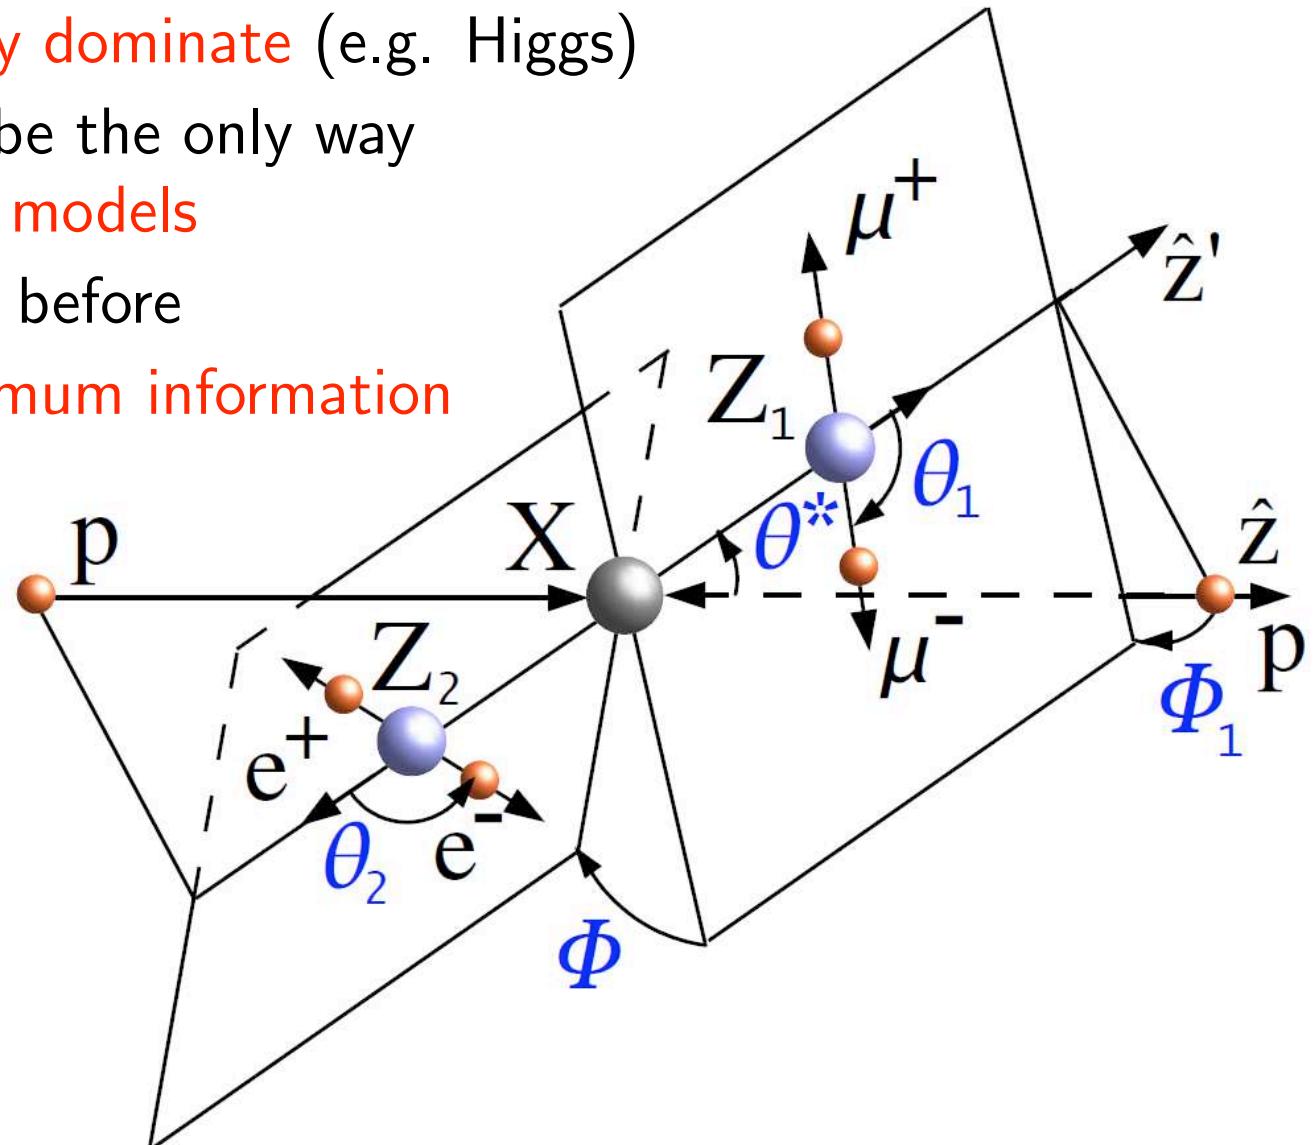

(!) spin-2 not excluded

$\cos\theta^*$ could be the same (but not with min coupling):

$$\frac{16 d\Gamma}{10 \Gamma d \cos\theta^*} = (f_{z1} + f_{z2}) + 3(2 - 3f_{z1} - 2f_{z2}) \cos^2\theta^* - (6 - 10f_{z1} - 5f_{z2}) \cos^4\theta^*$$

Kinematics of $X \rightarrow ZZ$ and WW

- Full information production & decay angles \Rightarrow multivariate analysis
 - ZZ & WW may dominate (e.g. Higgs)
 - if not, may still be the only way to differentiate models
 - not fully studied before
 - concept of maximum information

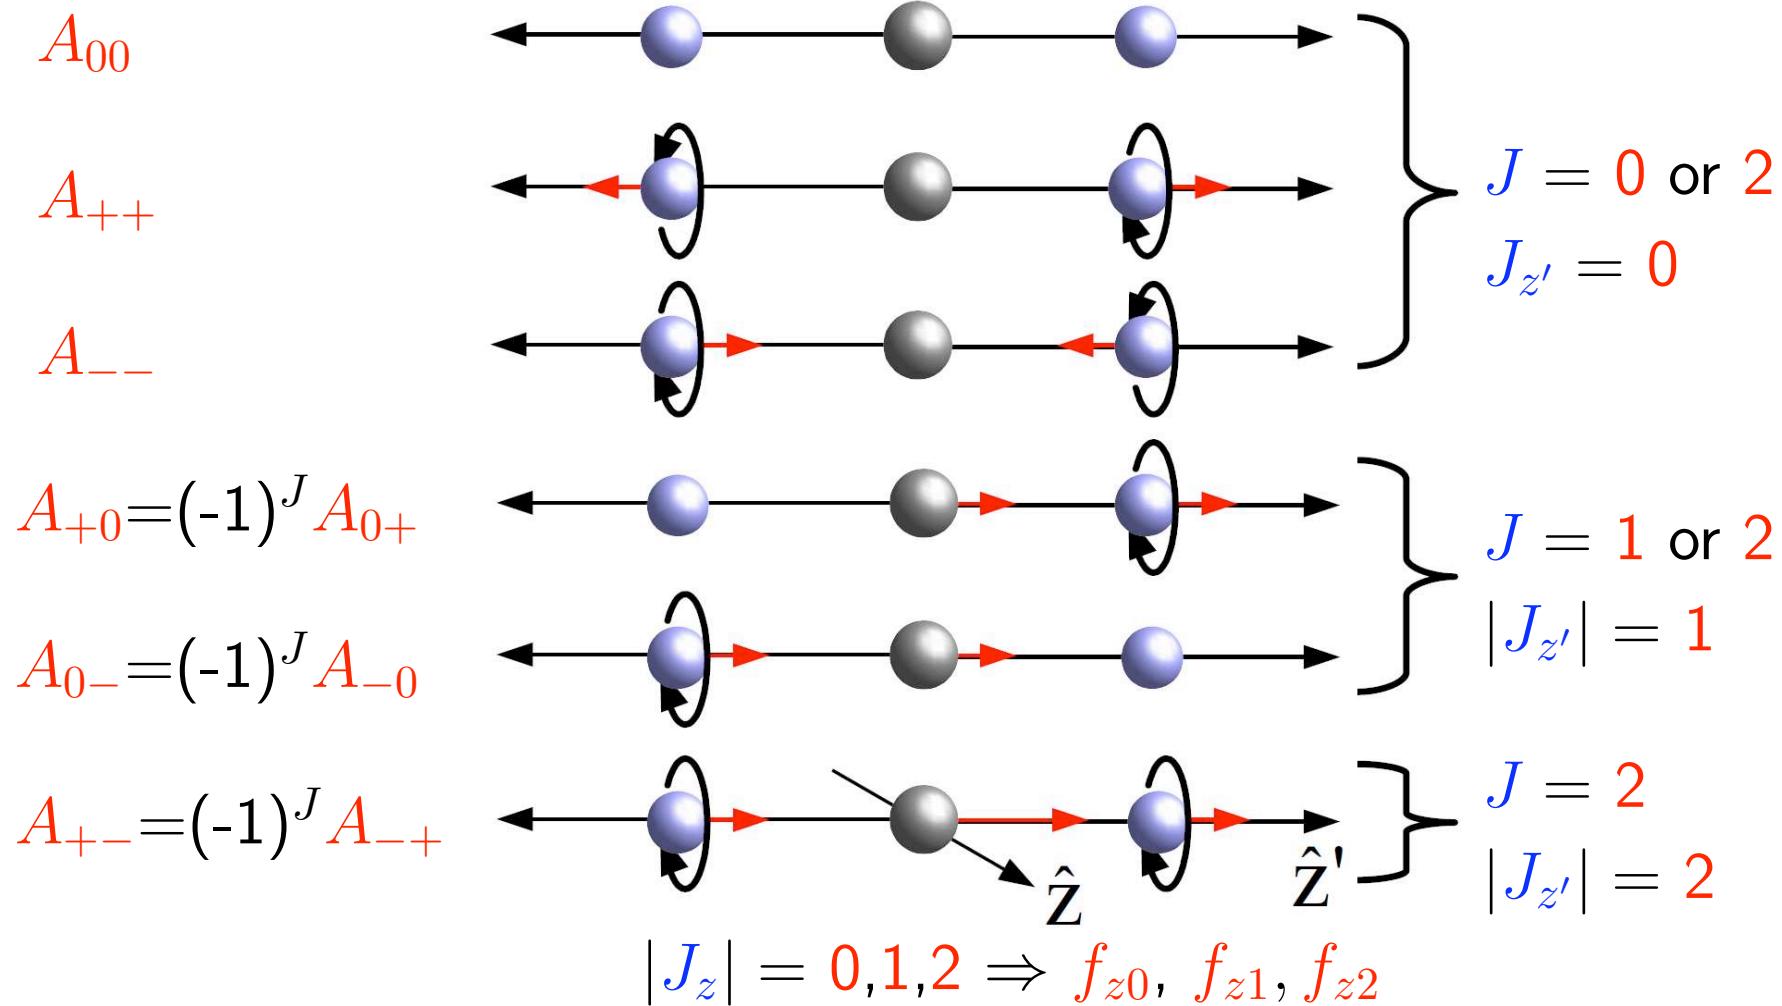

Decay of New Resonances

- Experimental goal: measure all polarizations (both \hat{z} and \hat{z}')

symmetry in $X \rightarrow ZZ$: $A_{\lambda_1 \lambda_2} = (-1)^J A_{\lambda_2 \lambda_1}$

if parity is a symmetry: $A_{\lambda_1 \lambda_2} = \eta_X (-1)^J A_{-\lambda_1 - \lambda_2}$ (do not use)

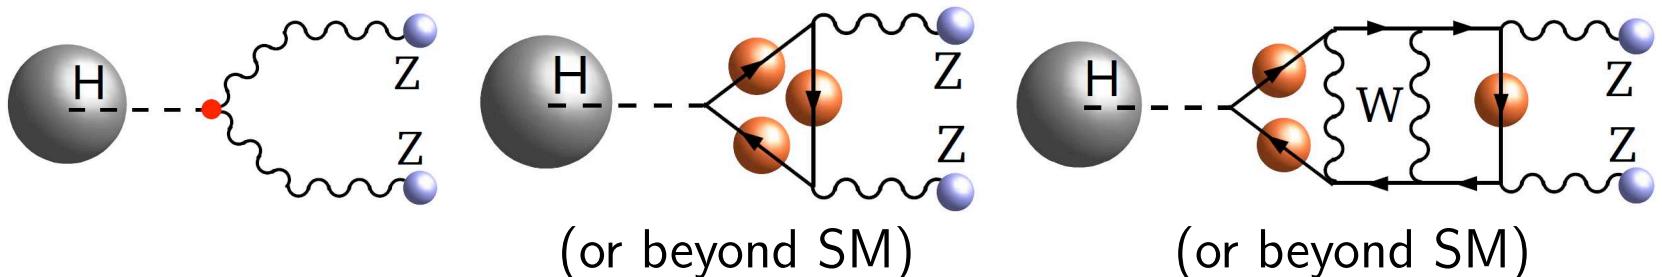

Connect “theory” and “experiment”

Amplitude for Spin-0

- Amplitude for $X_{J=0} \rightarrow V_1 V_2$ (compare $B \rightarrow V_1 V_2$ PRD45,193(1992))

$$A = v^{-1} \epsilon_1^{*\mu} \epsilon_2^{*\nu} \left(a_1 g_{\mu\nu} M_X^2 + a_2 q_\mu q_\nu + a_3 \epsilon_{\mu\nu\alpha\beta} q_1^\alpha q_2^\beta \right)$$

- SM Higgs 0^+ : (a_1) CP \sim few% (a_2) CP $\sim 10^{-10}$? (a_3) \not{CP}

- 3 amplitudes (“experiment”) \Leftrightarrow 3 coupling constants (“theory”)

$$A_{00} = -\frac{M_X^2}{v} \left(a_1 \textcolor{blue}{x} + a_2 \frac{M_{V_1} M_{V_2}}{M_X^2} (\textcolor{blue}{x}^2 - 1) \right)$$

e.g. $M_{Z_2} < M_{Z_1}$

$$A_{\pm\pm} = + \frac{M_X^2}{v} \left(a_1 \pm i a_3 \frac{M_{V_1} M_{V_2}}{M_X^2} \sqrt{\textcolor{blue}{x}^2 - 1} \right)$$

at $M_H < 2M_Z$
 but $a_i(M_{Z_2})$

$x = \frac{M_X^2 - M_{V_1}^2 - M_{V_2}^2}{2M_{V_1}M_{V_2}} \gg 1$ for $\frac{M_X}{M_V} \gg 1 \Rightarrow A_{00}$ dominates for 0^+

Amplitude for Spin-1

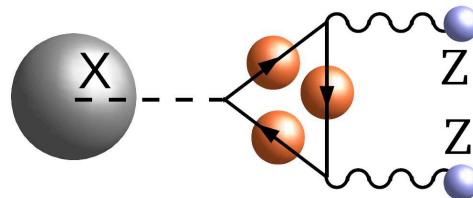

- Most general amplitude for $X_{J=1} \rightarrow VV$

$$A = b_1 [(\epsilon_1^* q_2)(\epsilon_2^* \epsilon_X) + (\epsilon_2^* q_1)(\epsilon_1^* \epsilon_X)] + b_2 \epsilon_{\alpha\mu\nu\beta} \epsilon_X^\alpha \epsilon_1^{*,\mu} \epsilon_2^{*,\nu} (q_1 - q_2)^\beta$$

$1^- CP$
 $1^+ \not{CP}$

$1^- \not{CP}$
 $1^+ CP$

Example:

- 2 amplitudes (“experiment”) \Leftrightarrow 2 coupling constants (“theory”)

$$A_{+0} \equiv -A_{0+} = \frac{\beta m_X^2}{2m_Z} (b_1 + i\beta b_2)$$

$$A_{-0} \equiv -A_{0-} = \frac{\beta m_X^2}{2m_Z} (b_1 - i\beta b_2)$$

(compare $Z' \rightarrow ZZ$ PRL101,091802(2008)
but b_1 and b_2 generally complex)

Amplitude for Spin-2

$2^+ CP$

$2^+ \not{CP}$

$2^- CP$

$$A = \frac{e_1^{*\mu} e_2^{*\nu}}{\Lambda} \left[c_1 t_{\mu\nu}(q_1 q_2) + c_2 g_{\mu\nu} t_{\alpha\beta}(q_1 - q_2)^\alpha (q_1 - q_2)^\beta \right.$$

$$+ \frac{c_3 t_{\alpha\beta}}{M_X^2} q_{2\mu} q_{1\nu} (q_1 - q_2)^\alpha (q_1 - q_2)^\beta + 2c_4 (t_{\mu\alpha} q_{1\nu} q_2^\alpha + t_{\nu\alpha} q_{2\mu} q_1^\alpha)$$

$$+ \frac{c_5 t_{\alpha\beta}}{M_X^2} (q_1 - q_2)^\alpha (q_1 - q_2)^\beta \epsilon_{\mu\nu\rho\sigma} q_1^\rho q_2^\sigma + c_6 t^{\alpha\beta} (q_1 - q_2)_\beta \epsilon_{\mu\nu\alpha\rho} q^\rho$$

$$\left. + \frac{c_7 t^{\alpha\beta}}{M_X^2} (q_1 - q_2)_\beta (\epsilon_{\alpha\mu\rho\sigma} q^\rho (q_1 - q_2)^\sigma q_\nu + \epsilon_{\alpha\nu\rho\sigma} q^\rho (q_1 - q_2)^\sigma q_\mu) \right]$$

- 6 **amplitudes** (“experiment”) \Leftrightarrow 6 combinations of coupl. const.

$$A_{00} = \frac{M_X^4}{M_V^2 \sqrt{6} \Lambda} \left[\left(1 + \beta^2\right) \left(\frac{c_1}{8} - \frac{c_2}{2} \beta^2\right) - \beta^2 \left(\frac{c_3}{2} \beta^2 - c_4\right) \right]$$

$$A_{\pm\pm} = \frac{M_X^2}{\sqrt{6} \Lambda} \left[\frac{c_1}{4} \left(1 + \beta^2\right) + 2c_2 \beta^2 \pm i\beta (c_5 \beta^2 - 2c_6) \right]$$

$$A_{\pm 0} \equiv A_{0\pm} = \frac{M_X^3}{M_V \sqrt{2} \Lambda} \left[\frac{c_1}{8} \left(1 + \beta^2\right) + \frac{c_4}{2} \beta^2 \mp i\beta \frac{(c_6 + c_7 \beta^2)}{2} \right]$$

$$A_{+-} \equiv A_{-+} = \frac{M_X^2}{4 \Lambda} c_1 \left(1 + \beta^2\right)$$

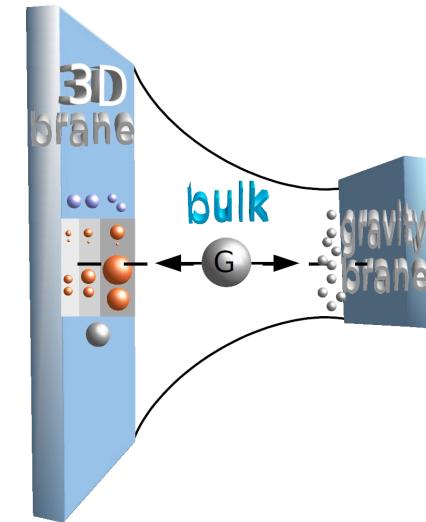

Note about Graviton couplings

- Minimal G_{RS} coupling:

$$A \propto \frac{1}{\Lambda} t_{\mu\nu} T^{\mu\nu}$$

→ energy-mom tensor → SM field-strength tensor

$$T_{\mu\nu} = F_{\mu\alpha}^{*(1)} F_{\nu\beta}^{*(2)} g^{\alpha\beta} + m_V^2 \epsilon_1^{*\mu} \epsilon_2^{*\nu} \quad \& \quad F^{(i)\mu\nu} = \epsilon_i^\mu q_i^\nu - \epsilon_i^\nu q_i^\mu$$

- Consequence: $c_2 = \frac{c_4}{2} \simeq -\frac{c_1}{4}$ (as $\beta \rightarrow 1$) $\Rightarrow A_{+-} \& A_{-+}$ dominate

\Rightarrow production $gg \rightarrow X$ only $J_z = \pm 2 \Rightarrow f_{z0} = 0$

\Rightarrow decay at $m_G = 250$ GeV $f_{+-} + f_{-+} = 0.56, f_{00} = 0.11$

at $m_G = 1000$ GeV $f_{+-} + f_{-+} = 0.89, f_{00} = 0.11$

- Non-minimal coupling (e.g. SM in the bulk)

generally $A_{00} \propto \frac{M_X^4}{M_V^2 \Lambda}$ dominates, $f_{00} \rightarrow 1.0$

- Notation later: 2_m^+ (minimal G), 2_L^+ (longitudinal G)

Coupling to fermions

- For completeness $X \rightarrow q\bar{q}$, also to describe $q\bar{q} \rightarrow X$:
 - example of spin-2:

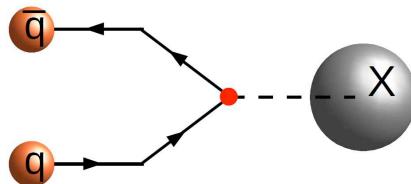

$$A = \frac{1}{\Lambda} t^{\mu\nu} \bar{u}_{q_1} \left(\gamma_\mu \Delta q_\nu (\rho_1 + \rho_2 \gamma_5) + \frac{m_q}{\Lambda^2} \Delta q_\mu \Delta q_\nu (\rho_3 + \rho_4 \gamma_5) \right) v_{q_2}$$

- 4 amplitudes (“experiment”) \Leftrightarrow 4 coupling constants (“theory”)

$$A_{\pm\pm} = \frac{2\sqrt{2} m_q M_X \beta}{\sqrt{3}\Lambda} \left(\pm \rho_1 + \frac{\beta M_X^2}{2\Lambda^2} (\rho_4 \mp \rho_3 \beta) \right)$$

$$A_{\pm\mp} = \frac{M_X^2 \beta}{\Lambda} (\mp \rho_1 - \beta \rho_2)$$

- Consequence of m_q (chiral symmetry)

$$\Rightarrow A_{++} = A_{--} = 0 \text{ at } m_q \rightarrow 0$$

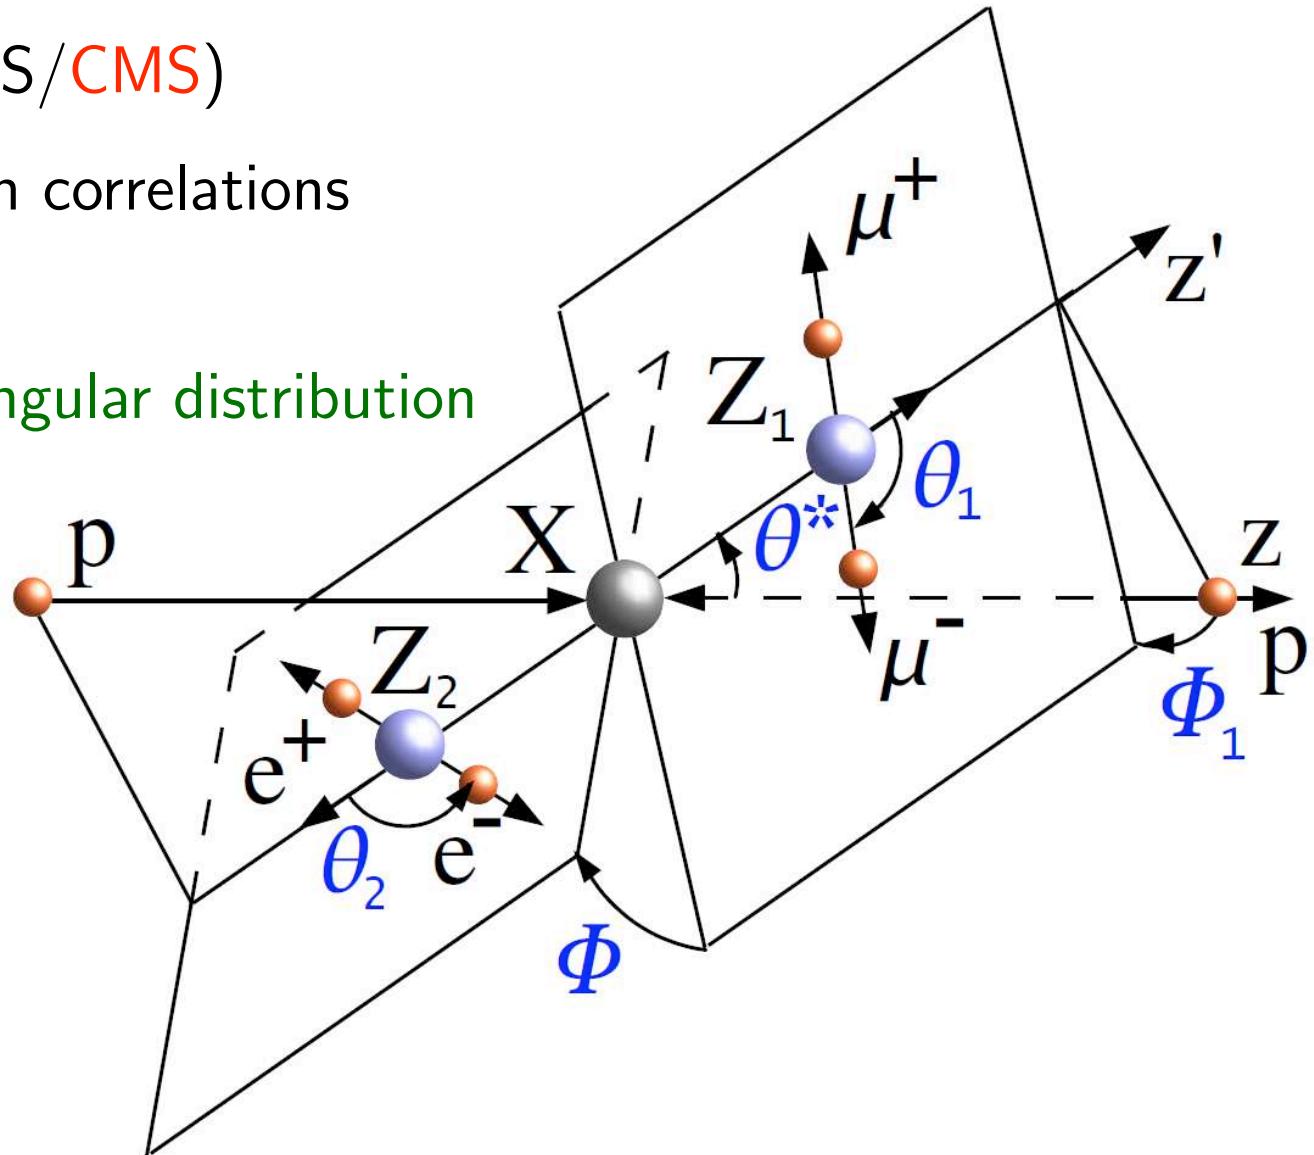

$$\Rightarrow A_{\uparrow\downarrow}, A_{\downarrow\uparrow} \Rightarrow J_z = \pm 1 \text{ in } q\bar{q} \rightarrow X$$

How to measure polarization

How to Measure Polarization

- Deduce all $A_{\lambda_1 \lambda_2}$ from angular distributions, but need:

- (1) detector (ATLAS/CMS)
- (2) MC with all spin correlations
(none before)
- (3) full analytical angular distribution
(none before)
- (4) fit
(learn from B 's)

Monte Carlo Simulation

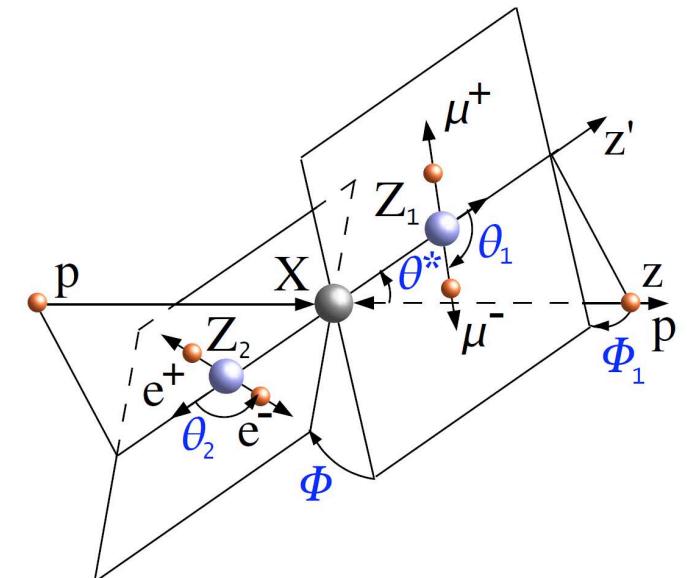

- MC program, open access: <http://www.pha.jhu.edu/spin/>
 - complete kinematic chain (BW) $ab \rightarrow X \rightarrow ZZ \rightarrow (f_1\bar{f}_1)(f_2\bar{f}_2)$
 - calculate matrix element $|M|^2$ (narrow-width approximation)
 - weigh or accept/discard events

- Important features:

- most general couplings for $J = 0, 1, 2$
 - e.g. Higgs radiative corrections
 - e.g. non-minimal G couplings, $Z' \rightarrow ZZ$
 - any angular distribution from QM
 - interface to detector simulation (Pythia)

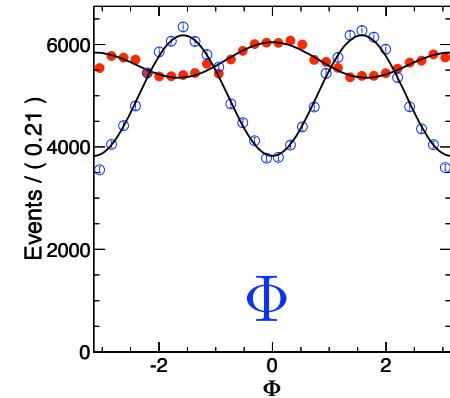

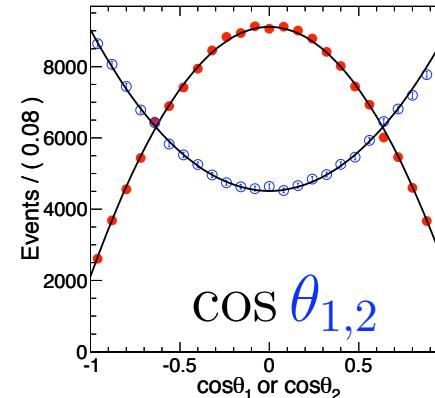

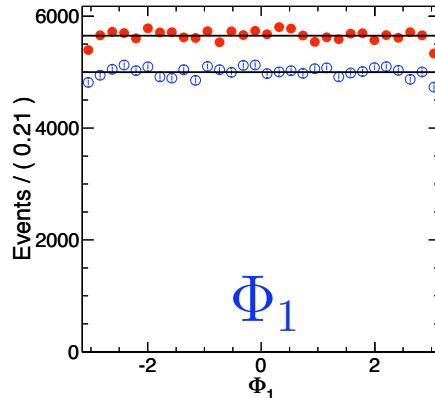

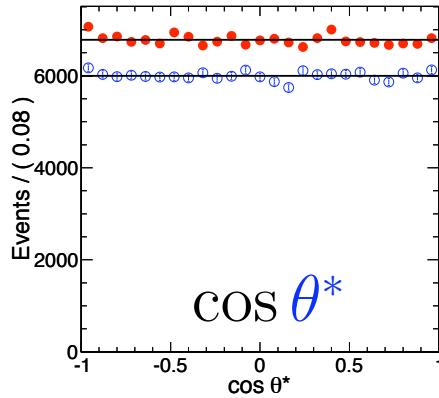

- Background

- MadGraph: $q\bar{q} \rightarrow ZZ$ ($gg \rightarrow ZZ \sim 15\%$)
 - others negligible: $Zb\bar{b}$, $t\bar{t}$, $W^+W^-b\bar{b}$, WWZ , $t\bar{t}Z$, $4b$
 l^\pm isolation, $4l$ vertex, $2l$ mass, (no missing energy)...

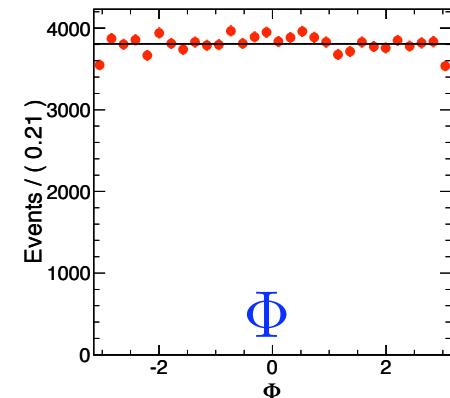

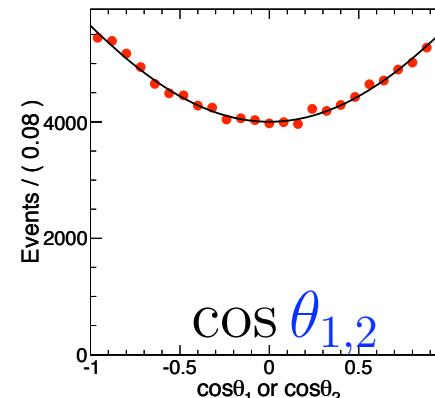

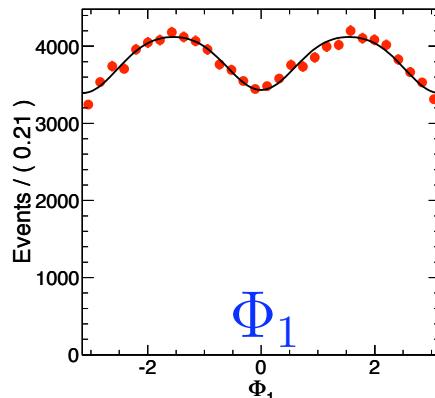

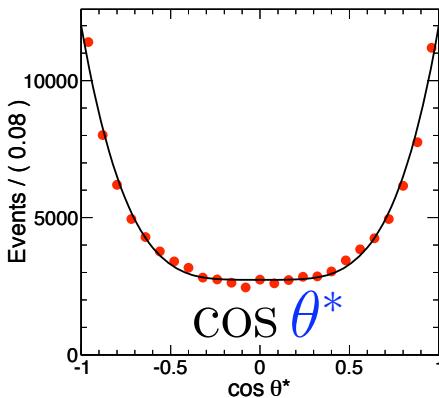

Simulation Examples

- Higgs 0^+ (SM tree-level, a_1) and 0^- (a_3) at $m_H = 250$ GeV
 - lines from derived distributions (independent, next slides)

- Background $q\bar{q} \rightarrow ZZ$
 - lines empirical shape

Angular Distributions

- Connect **amplitudes** and **angular distributions**
for any $J = 0, 1, 2, 3, 4, \dots$

$$A_{ab} \propto D_{\chi_1 - \chi_2, m}^{J*}(\Omega^*) B_{\chi_1 \chi_2} \times D_{m, \lambda_1 - \lambda_2}^{J*}(\Omega) A_{\lambda_1 \lambda_2} \\ \times D_{\lambda_1, \mu_1 - \mu_2}^{s_1*}(\Omega_1) T(\mu_1, \mu_2) \times D_{\lambda_2, \tau_1 - \tau_2}^{s_2*}(\Omega_2) W(\tau_1, \tau_2)$$

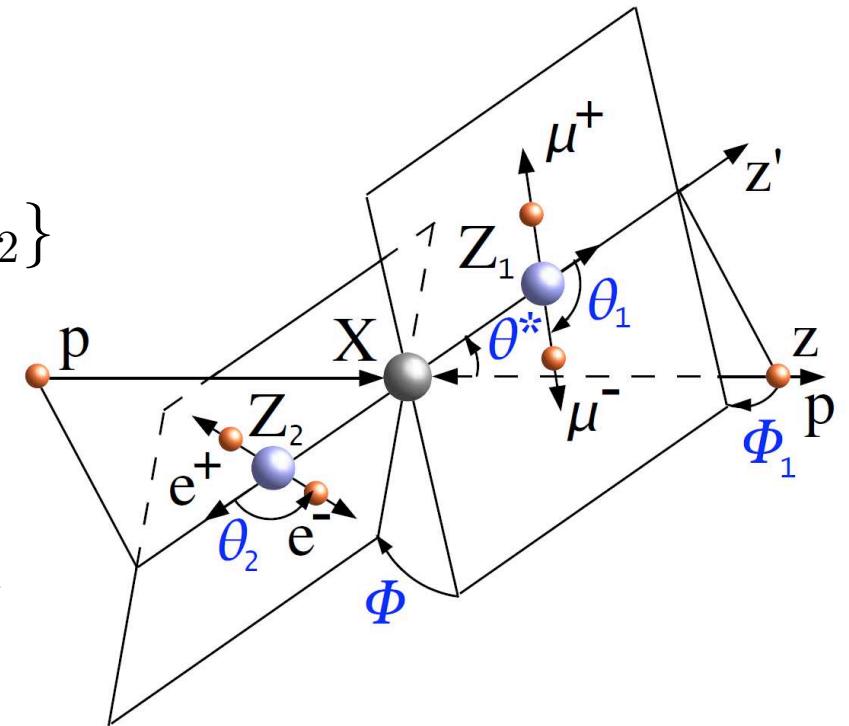

$$d\sigma \propto \sum_{\chi, \mu, \tau} \left| \sum_{\lambda, m} A_{ab}(\{\Omega\}) \right|^2$$

$ab \rightarrow X, \quad \Omega^* = (\Phi_1, \theta^*, -\Phi_1), \quad \{\chi_1 \chi_2\}$

$X \rightarrow Z_1 Z_2, \quad \Omega = (0, 0, 0), \quad \{\lambda_1 \lambda_2\}$

$Z_1 \rightarrow f_1 \bar{f}_1, \quad \Omega_1 = (0, \theta_1, 0), \quad \{\mu_1, \mu_2\}$

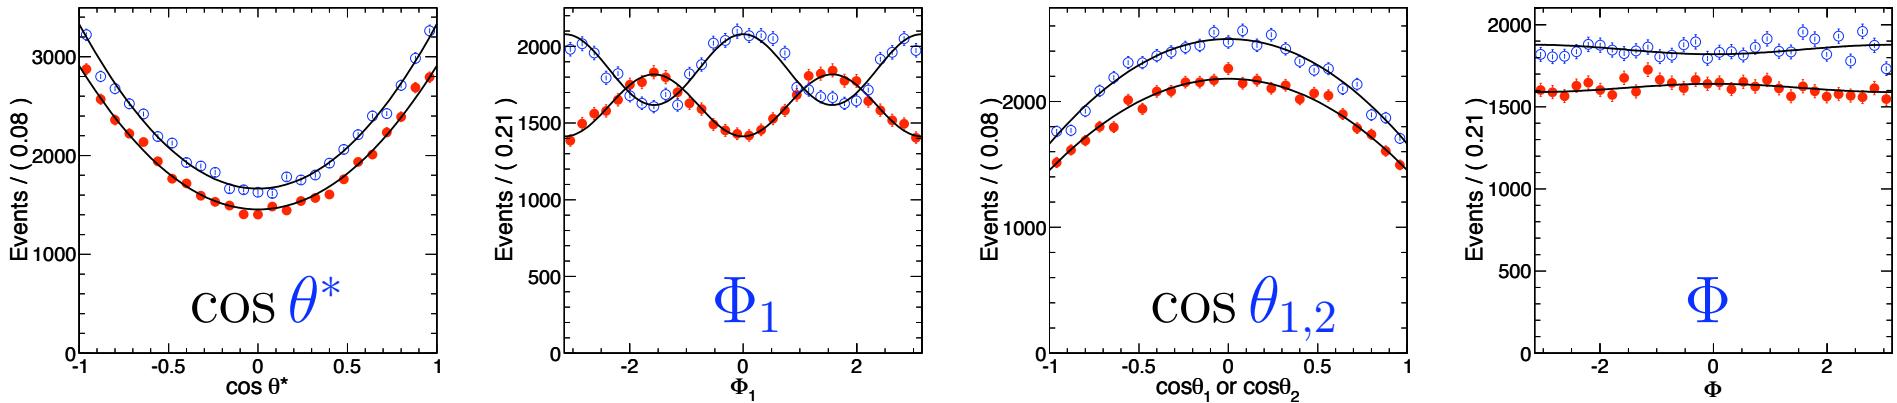

$Z_2 \rightarrow f_2 \bar{f}_2, \quad \Omega_2 = (\Phi, \theta_2, -\Phi), \quad \{\tau_1, \tau_2\}$

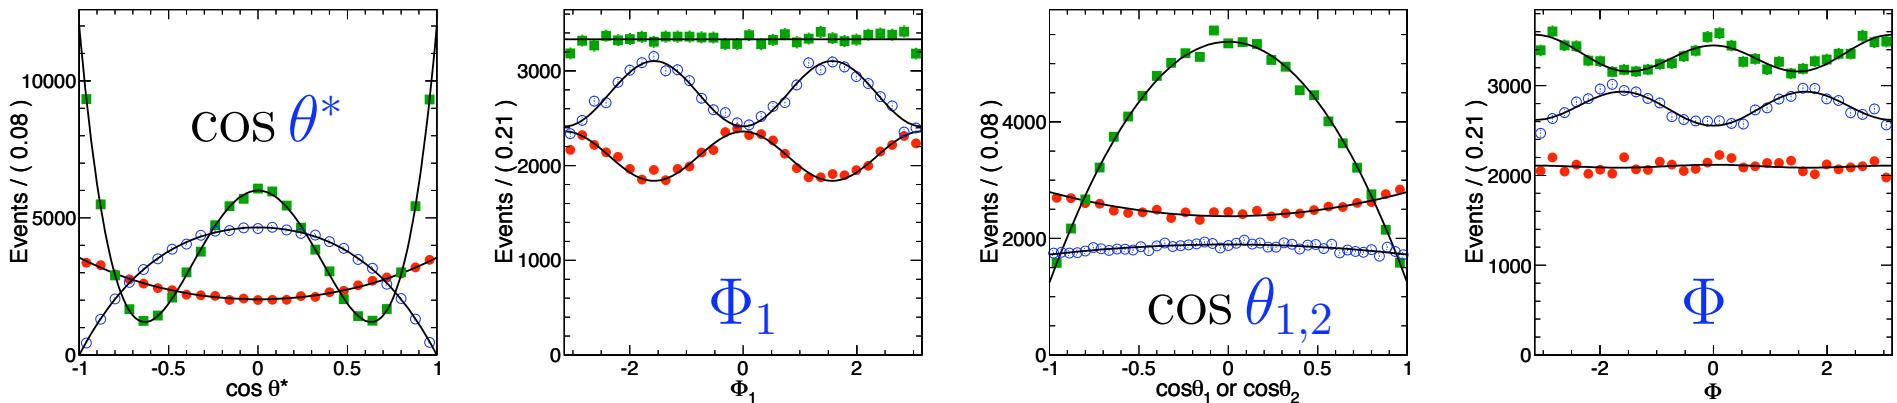

$$r = c_A/c_V \Rightarrow R_{1,2} = 2r_{1,2}/(1 + r_{1,2}^2) = 0.15 \text{ } (l^\pm), 0.67 \text{ } (u), 0.94 \text{ } (d)$$

More Distribution Examples

- Vector 1^- (b_1) and 1^+ (b_2) at $m_H = 250$ GeV
 - lines from derived distributions, points from MC

- G 2_m^+ (minimal), 2_L^+ (Higgs-like), and 2^- ($c_{5,6}$) at $m_H = 250$ GeV

Explicit Distributions for any J

- $d\Gamma(ab \rightarrow X_J \rightarrow ZZ \rightarrow (f_1 \bar{f}_1)(f_2 \bar{f}_2)) \propto$

$$F_{00}^J(\theta^*) \times \left\{ 4 \textcolor{red}{f}_{00} \sin^2 \theta_1 \sin^2 \theta_2 + (\textcolor{red}{f}_{++} + \textcolor{red}{f}_{--}) ((1 + \cos^2 \theta_1)(1 + \cos^2 \theta_2) + 4R_1 R_2 \cos \theta_1 \cos \theta_2) \right. \\ - 2(\textcolor{red}{f}_{++} - \textcolor{red}{f}_{--})(R_1 \cos \theta_1 (1 + \cos^2 \theta_2) + R_2 (1 + \cos^2 \theta_1) \cos \theta_2) \\ + 4\sqrt{\textcolor{red}{f}_{++} f_{00}} (R_1 - \cos \theta_1) \sin \theta_1 (R_2 - \cos \theta_2) \sin \theta_2 \cos(\Phi + \phi_{++}) \\ + 4\sqrt{\textcolor{red}{f}_{--} f_{00}} (R_1 + \cos \theta_1) \sin \theta_1 (R_2 + \cos \theta_2) \sin \theta_2 \cos(\Phi - \phi_{--}) \\ \left. + 2\sqrt{\textcolor{red}{f}_{++} f_{--}} \sin^2 \theta_1 \sin^2 \theta_2 \cos(2\Phi + \phi_{++} - \phi_{--}) \right\} \quad \text{spin} = 0 \text{ \& } \geq 2$$

$$+ 4F_{11}^J(\theta^*) \times \left\{ (\textcolor{red}{f}_{+0} + \textcolor{red}{f}_{0-})(1 - \cos^2 \theta_1 \cos^2 \theta_2) - (\textcolor{red}{f}_{+0} - \textcolor{red}{f}_{0-})(R_1 \cos \theta_1 \sin^2 \theta_2 + R_2 \sin^2 \theta_1 \cos \theta_2) \right. \\ \left. + 2\sqrt{\textcolor{red}{f}_{+0} f_{0-}} \sin \theta_1 \sin \theta_2 (R_1 R_2 - \cos \theta_1 \cos \theta_2) \cos(\Phi + \phi_{+0} - \phi_{0-}) \right\}$$

$$+ 4F_{-11}^J(\theta^*) \times (-1)^J \times \left\{ (\textcolor{red}{f}_{+0} + \textcolor{red}{f}_{0-})(R_1 R_2 + \cos \theta_1 \cos \theta_2) - (\textcolor{red}{f}_{+0} - \textcolor{red}{f}_{0-})(R_1 \cos \theta_2 + R_2 \cos \theta_1) \right. \\ \left. + 2\sqrt{\textcolor{red}{f}_{+0} f_{0-}} \sin \theta_1 \sin \theta_2 \cos(\Phi + \phi_{+0} - \phi_{0-}) \right\} \sin \theta_1 \sin \theta_2 \cos(2\Psi) \quad \text{spin} = 1 \text{ \& } \geq 2$$

$$+ 2F_{22}^J(\theta^*) \times \textcolor{red}{f}_{+-} \left\{ (1 + \cos^2 \theta_1)(1 + \cos^2 \theta_2) - 4R_1 R_2 \cos \theta_1 \cos \theta_2 \right\}$$

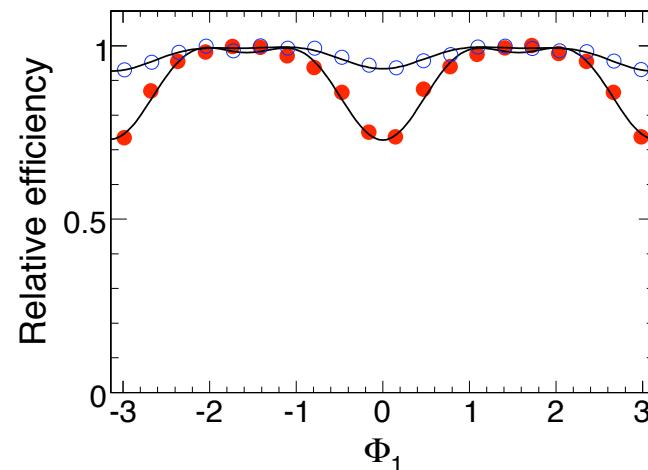

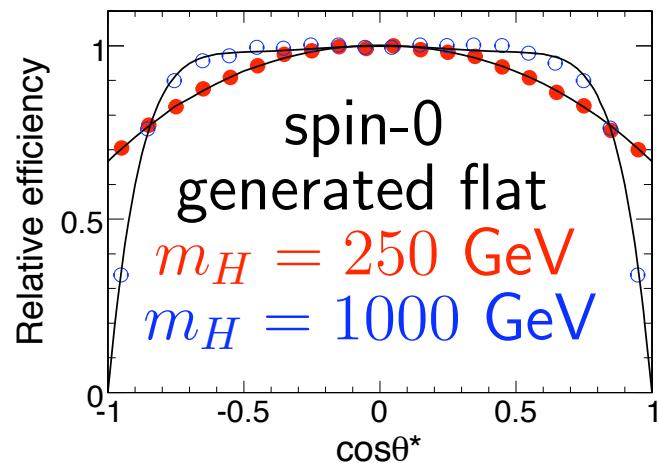

$$+ 2F_{-22}^J(\theta^*) \times (-1)^J \times \textcolor{red}{f}_{+-} \sin^2 \theta_1 \sin^2 \theta_2 \cos(4\Psi) \quad \text{spin} \geq 2 \text{ unique}$$

+ other 26 interference terms for spin ≥ 2

where $\Psi = \Phi_1 + \Phi/2$ and $F_{ij}^J(\theta^*) = \sum_{m=0,\pm 1,\pm 2} \textcolor{red}{f}_m d_{mi}^J(\theta^*) d_{mj}^J(\theta^*)$

Detector Effects

- Detector effects shape angular distributions (CMS as a reference):
 - (1) track parameter resolution $\Rightarrow \pm 0.01 \text{ rad}$ angles
 $\pm 3.5 \text{ GeV}$ mass at 250 GeV
 - (2) loss of tracks at $\theta_{\text{lab}} < \theta_{\min}$ ($\eta_{\max} = 2.5$)
(along the beampipe)

– major effect to account for in analysis
acceptance function $\mathcal{G}(\Phi_1, \theta^*, \theta_1, \theta_2, \Phi; Y_X)$

- Fast MC: **reject tracks** and **smear track parameters**

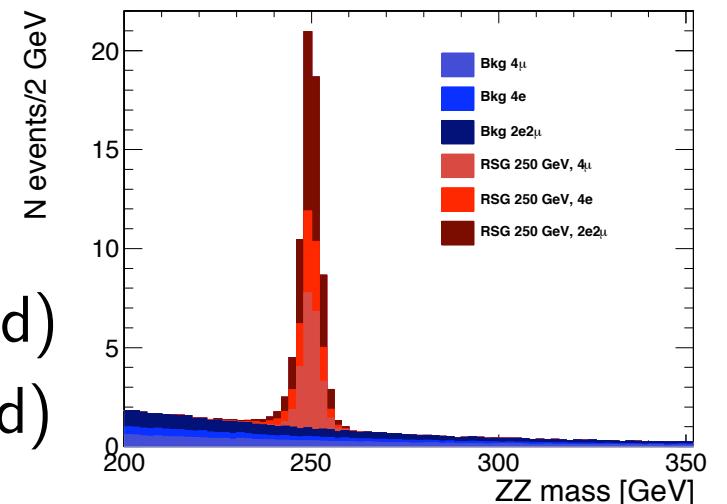

Data Analysis (shown with MC)

Analysis Goals

- Analysis depends on how we ask the **question**:
 - (1) compare hypotheses **h1** and **h2**: confidence in **one** vs **the other**

example (A): **h1**: signal + background
h2: only background

example (B): **h1**: signal 0^+ (+ background)
h2: signal 0^- (+ background)

- (2) determine **all parameters** at once (ultimately the best one can do)

yield, mass, width

spin (J)

coupling constants (amplitudes $A_{\lambda_1 \lambda_2}$)

production mechanism (initial polarization f_{zm})

Multivariate Maximum Likelihood Fit

- Maximize likelihood \mathcal{L} (RooFit/MINUIT, from $B \rightarrow VV$):

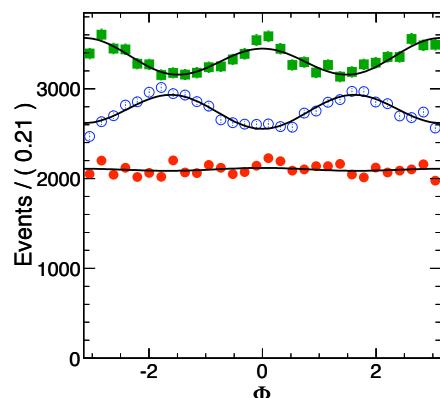

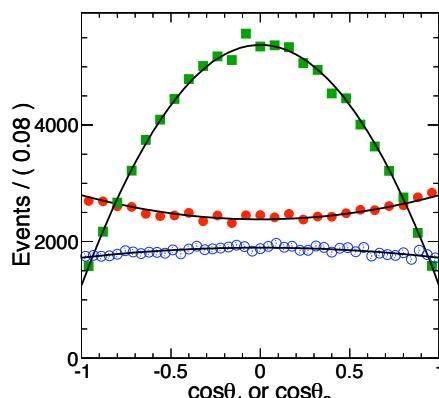

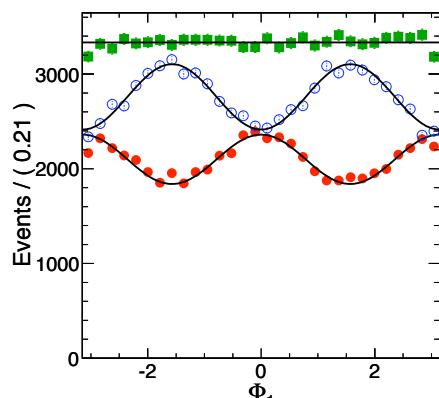

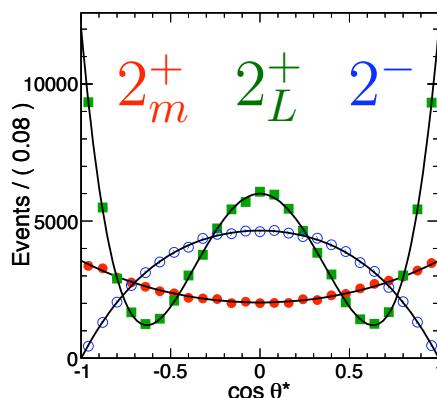

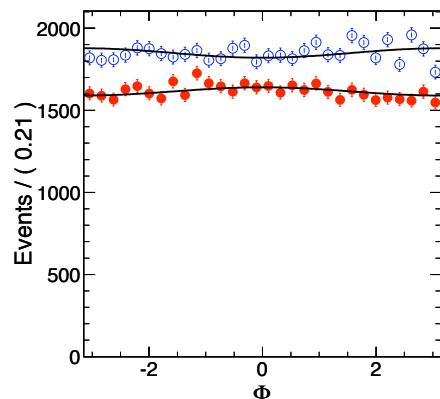

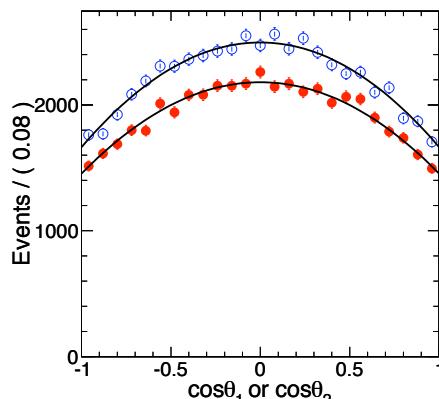

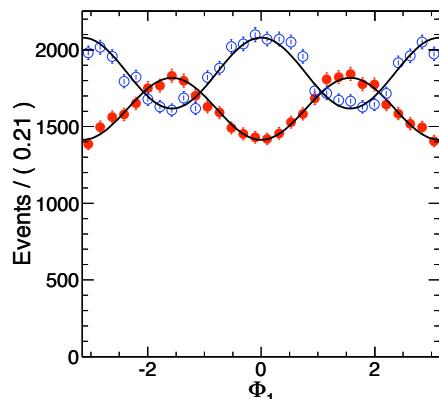

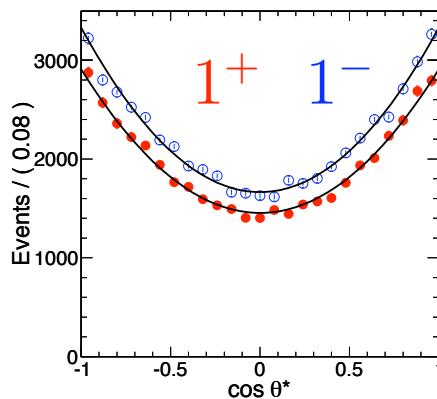

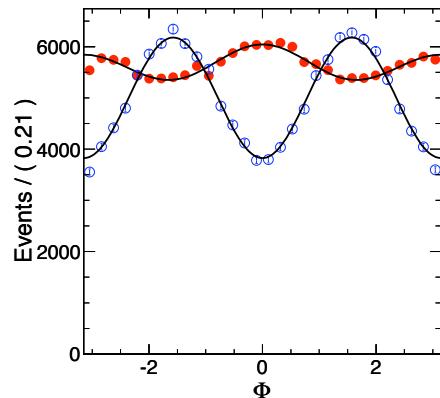

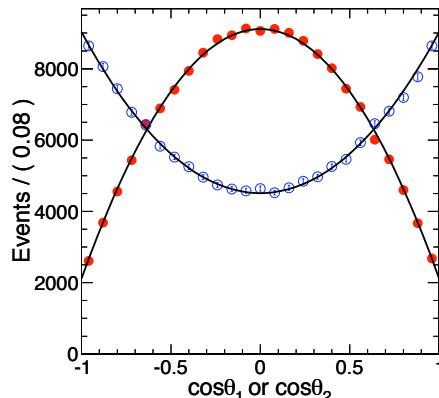

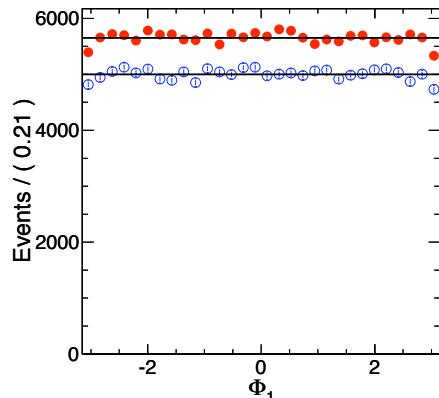

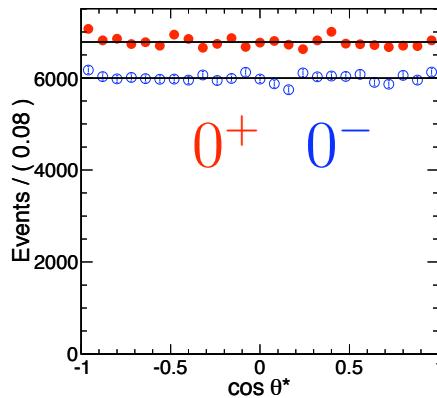

$$\mathcal{L} = \exp \left(- \sum_{J=1}^3 n_J - n_{\text{bkg}} \right) \prod_i^N \left(\sum_{J=1}^3 n_J \times \mathcal{P}_J(\vec{x}_i; \vec{\zeta}_J; \vec{\xi}) + n_{\text{bkg}} \times \mathcal{P}_{\text{bkg}}(\vec{x}_i; \vec{\xi}) \right)$$

$\vec{\zeta}_J = (f_{\lambda_1 \lambda_2}, \phi_{\lambda_1 \lambda_2}, f_{zm}; m_X, \Gamma_X)$, float n_J , fix or float m_X, Γ_X

$\vec{x}_i = (\theta^*, \Phi_1, \theta_1, \theta_2, \Phi; m_{ZZ}, \dots)$

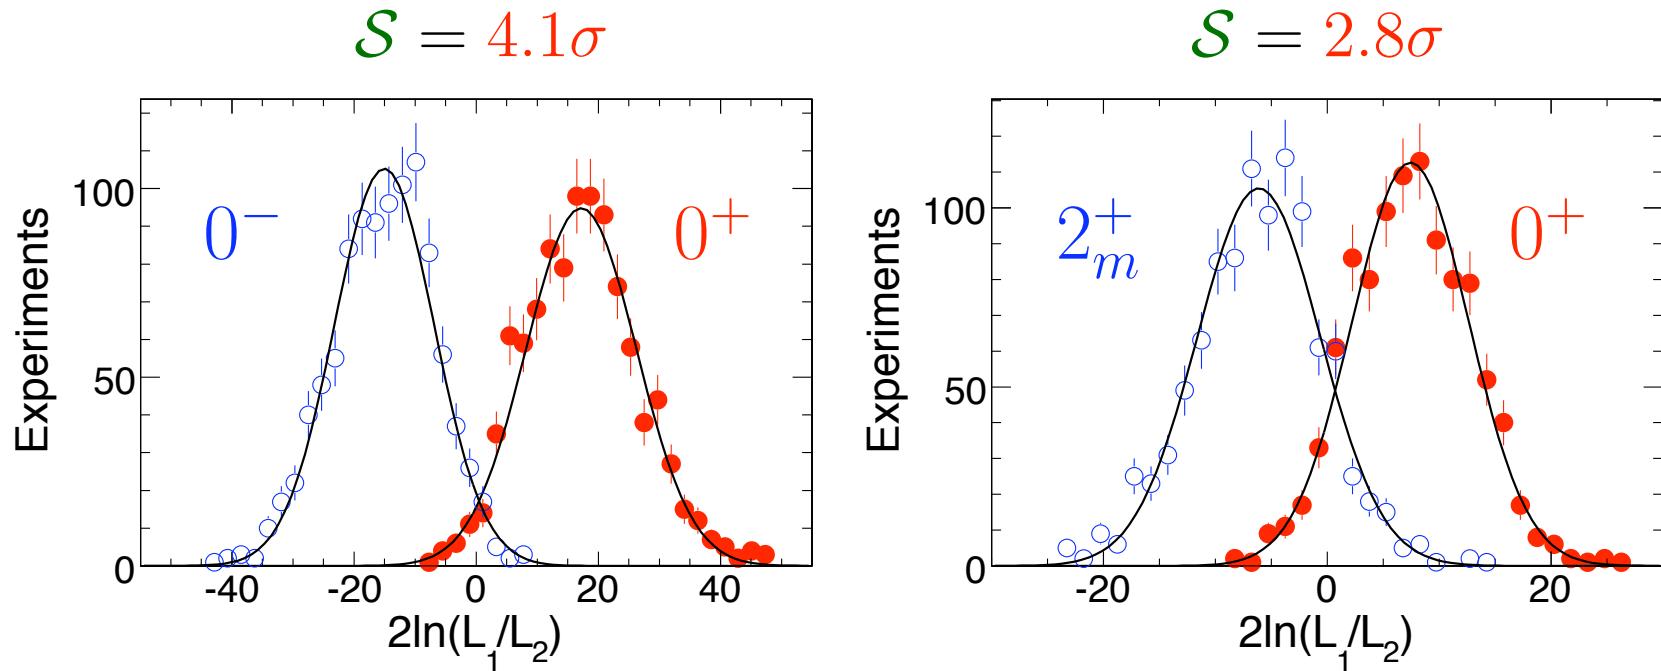

- Probability \mathcal{P} :
 - (a) template (fixed multi-D histogram)
 - (b) $\mathcal{P}_J = \mathcal{P}(m_{ZZ}, \dots) \times \mathcal{P}_{\text{ideal}}(\theta^*, \Phi_1, \theta_1, \theta_2, \Phi) \times \mathcal{G}(\theta^*, \Phi_1, \theta_1, \theta_2, \Phi; Y_X)$
- Our choice (b) \Leftarrow both approaches (1) and (2) possible:
 - (1) compare \mathcal{L}_1 vs \mathcal{L}_2 with parameters fixed ($f_{\lambda_1 \lambda_2}, \phi_{\lambda_1 \lambda_2}, f_{zm}$)
 - (2) fit for all parameters ($f_{\lambda_1 \lambda_2}, \phi_{\lambda_1 \lambda_2}, f_{zm}$)

Distribution Examples ($\theta^*, \Phi_1, \theta_1, \theta_2, \Phi$)

Analysis Approach (1)

- Pick a test scenario with Higgs $m_X = 250$ GeV
 - signal soon after discovery \Rightarrow 30 events (SM Higgs rate)
 - 24 background ($m_{ZZ} = 250 \pm 20$ GeV, $\mathcal{L} = 5/\text{fb}$, $E_{pp} = 14$ TeV)
 - significance 5.7σ signal/background; $\sim 20\%$ gain with angles
- Generate experiments 1000 times
 - plot $2 \ln(\mathcal{L}_1/\mathcal{L}_2)$ for h1 and h2
 - \mathcal{S} effective separation of peaks (Gaussian σ)

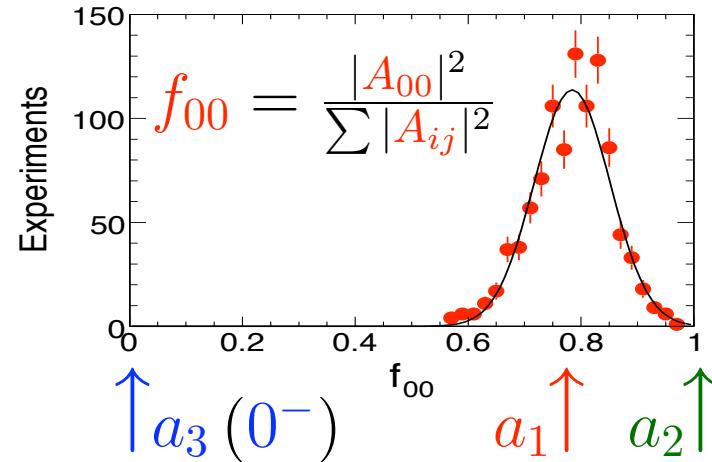

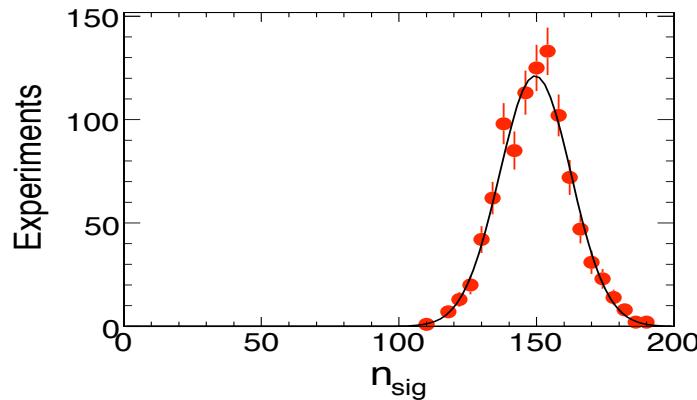

Analysis Approach (1): Results

- Example of separation at $m_X = 250$ GeV (similar at 1000 GeV)
 - with 30 events $\sim 2 - 4\sigma$ separation
 - full event info (production+decay) ⇒ ultimate precision
- 1D (θ^*) / 3D (θ_1, θ_2, Φ) / 5D ($\Phi_1, \theta^*, \theta_1, \theta_2, \Phi$)

	0 ⁻	1 ⁺	1 ⁻	2 ⁺ _m	2 ⁺ _L	2 ⁻
0 ⁺	0.0/3.9/ 4.1	0.8/1.8/2.3	0.9/2.5/ 2.6	0.8/2.4/ 2.8	2.6/0.0/2.6	1.6/2.4/3.3
0 ⁻	–	0.8/2.8/3.1	0.9/2.5/ 3.0	0.8/1.7/ 2.4	2.9/4.1/ 4.8	1.6/2.0/ 2.9
1 ⁺	–	–	0.0/1.1/2.2	0.1/1.3/ 2.6	2.8/1.9/ 3.6	2.5/1.2/ 2.9
1 ⁻	–	–	–	0.1/1.3/ 1.8	2.8/2.5/ 3.8	2.5/0.6/ 3.4
2 ⁺ _m	–	–	–	–	2.9/2.6/ 3.8	2.3/0.5/ 3.2
2 ⁺ _L	–	–	–	–	–	3.6/2.5/4.3

Analysis Approach (2)

- More general approach: fit all parameters (spin-0: Higgs 250 GeV)
 - $\times 5$ more events (150 signal & 120 background)

	generated	w/o detector	with detector
n_{sig}	150	150 ± 13	153 ± 15
f_{00}	0.792	0.79 ± 0.07	0.77 ± 0.08
$(f_{++} - f_{--})/2$	0.000	0.00 ± 0.07	0.01 ± 0.07
$(\phi_{++} + \phi_{--})/2$	π	3.15 ± 0.73	3.20 ± 0.77
$(\phi_{++} - \phi_{--})/2$	0	0.00 ± 0.53	0.01 ± 0.55

- Tested all 7 hypotheses at $m_X = 250$ and 1000 GeV

Conclusion

Conclusion

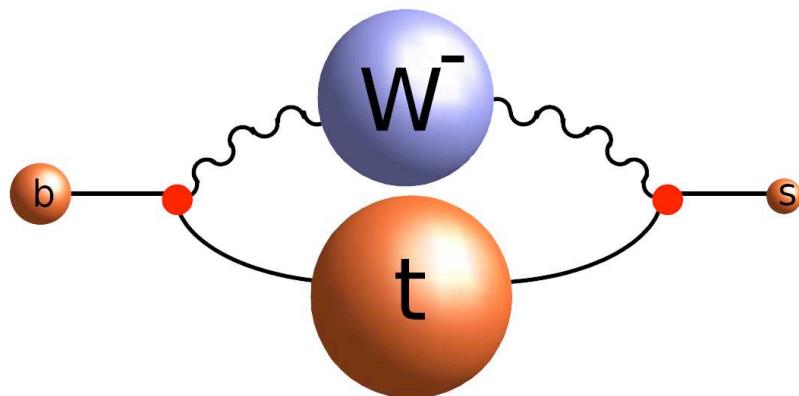

- B decays: polarization puzzle and power of angular analysis
- Resonances at LHC: either within (Higgs) or beyond SM
 - maximum info \Rightarrow spin, quantum numbers, couplings to SM
 - powerful angular technique, example $X_J \rightarrow ZZ/WW$
 - \rightarrow MC, angular distributions, ML fit $\rightarrow 3\text{-}4\sigma$ soon after discovery
 - model-independent approach (?)

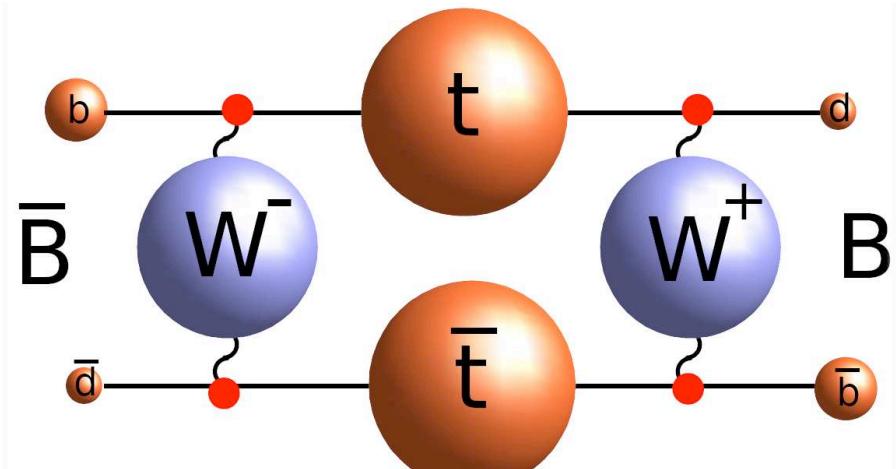

BACKUP

Loops

“penguin” loop

mixing “box”

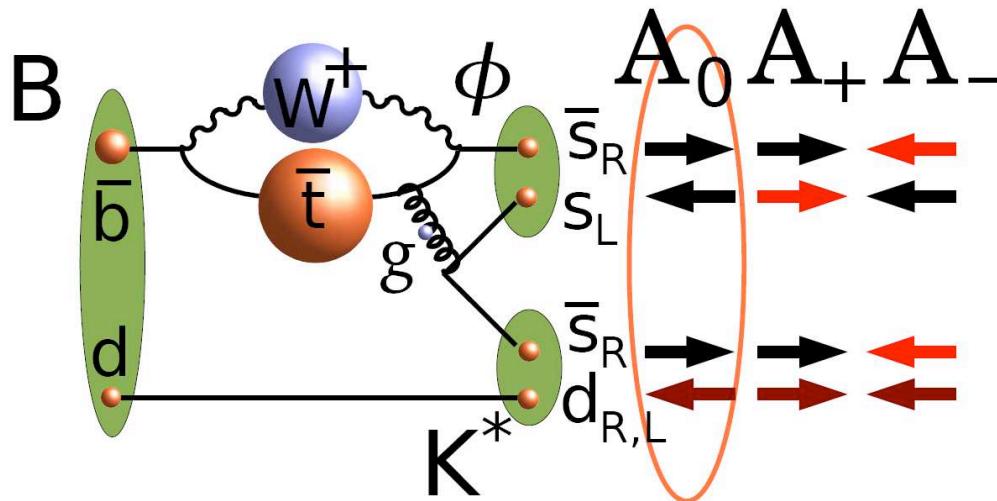

- B -meson physics: test $A = |A| \times e^{i\phi}$

- (1) transition rate $|A|^2$
- (2) phase $\phi = \arg(A)$

Best constraints on supersymmetry and New Physics

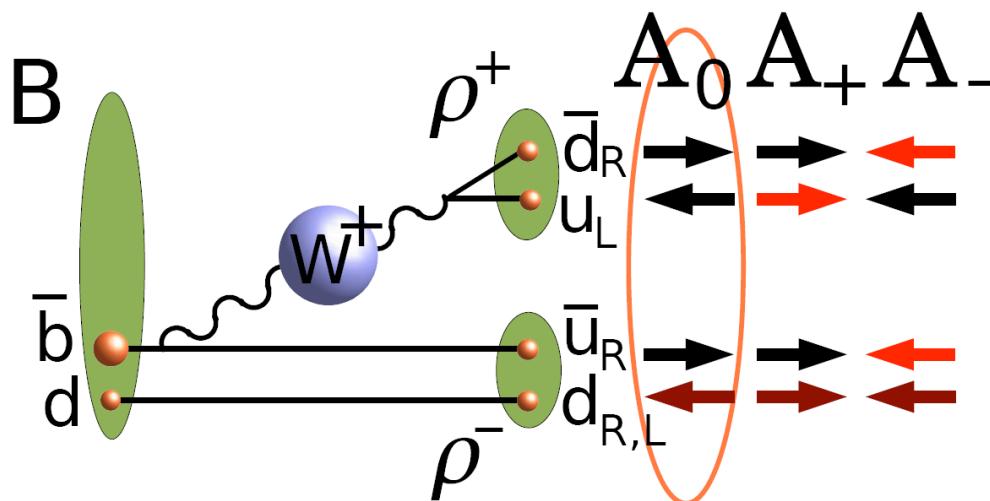

Spin Does Not Flip

- Observation $|A_{00}|^2 \simeq |A_{++}|^2 \gg |A_{--}|^2$ violates expectation

$$|A_{00}|^2 \gg |A_{++}|^2 \gg |A_{--}|^2$$

- It works: $B \rightarrow \rho^+ \rho^-$ $|A_{00}|^2 / (|A_{++}|^2 + |A_{--}|^2 + |A_{00}|^2) = 0.977^{+0.028}_{-0.024}$

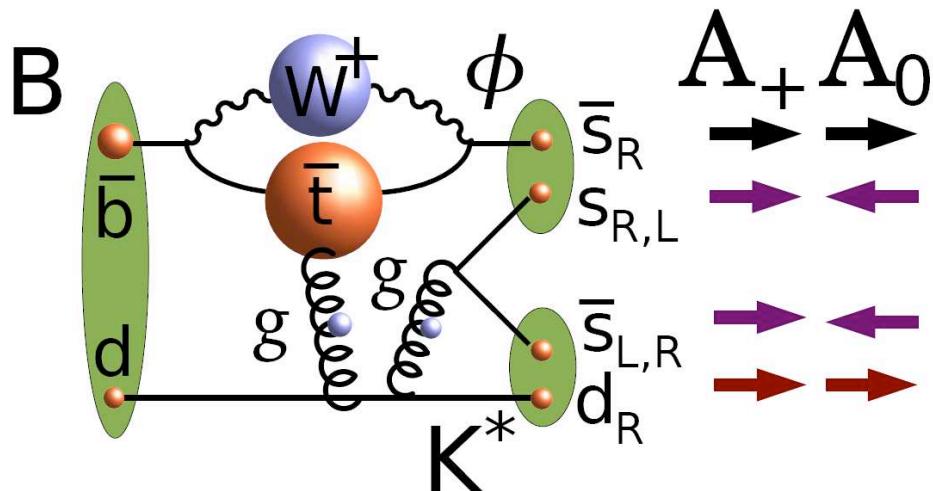

no loop contribution

ideal for CP studies in SM

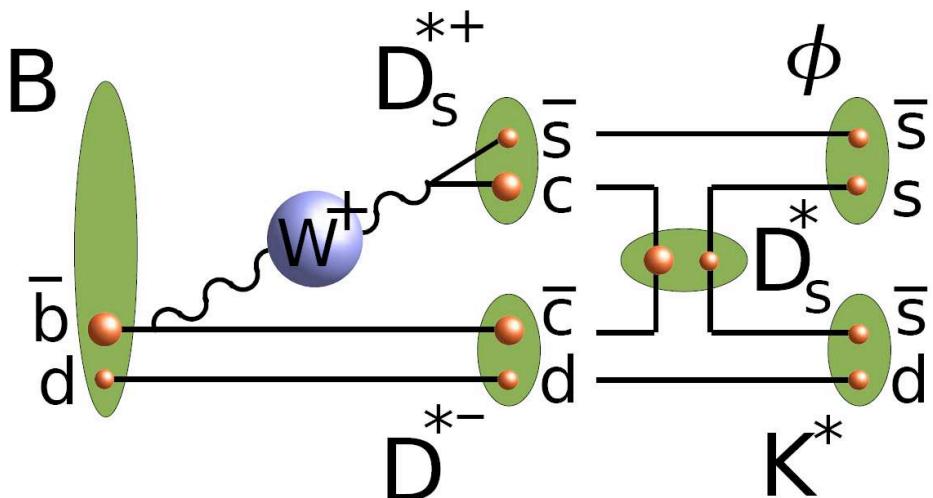

Scrambling to Explain A_{++}

- “Annihilation” mechanism

gluon to other quark
unlikely $\sim 1/m_B$
need to cancel A_{00}

- “Rescattering” mechanism (final state interaction)

spin-flip heavy $> 2\text{GeV}$ states
violates both $|A_{00}|^2 \gg |A_{\pm\pm}|^2$
and $|A_{++}|^2 \gg |A_{--}|^2$

- No satisfactory solution

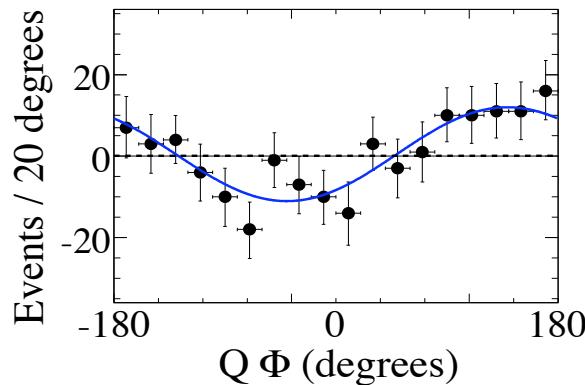

$B \rightarrow \varphi K^*$ polarization results

- Complex analysis with 12 independent results:

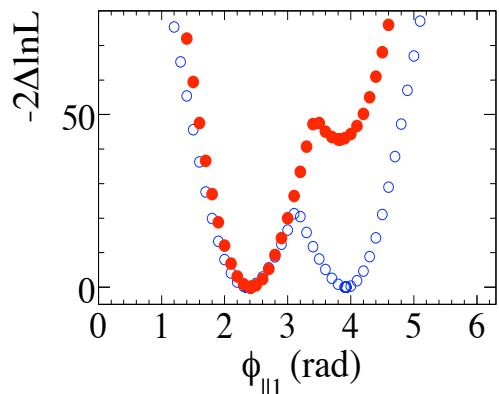

B (matter): $|A_{00}|, |A_{++}|, |A_{--}|, \arg(A_{00}), \arg(A_{++}), \arg(A_{--})$

\bar{B} (antimatter): $|\bar{A}_{00}|, |\bar{A}_{++}|, |\bar{A}_{--}|, \arg(\bar{A}_{00}), \arg(\bar{A}_{++}), \arg(\bar{A}_{--})$

- Examples:

$$\Rightarrow \arg(A_{00}) \neq \arg(A_{\pm\pm})$$

$K^*(892)/K_0^*(1430)$ interference

resolve $|A_{++}|^2 \gg |A_{--}|^2$

- Bottom line:

$$|A_{00}|^2 \simeq |A_{++}|^2 \gg |A_{--}|^2$$
$$\arg(A_{00}) \neq \arg(A_{++})$$

$X \rightarrow ZZ$ polarization notation

- Polarization notation:

$$e_1^\mu(\lambda_1 = 0) = \left(\frac{\beta M_X}{2M_V}, 0, 0, \frac{M_X}{2M_V} \right) \quad \perp \quad q_1^\mu = \left(\frac{M_X}{2}, 0, 0, \frac{\beta M_X}{2} \right)$$

$$e_1^\mu(\lambda_1 = \pm) = \frac{1}{\sqrt{2}}(0, \mp 1, -i, 0)$$

$$t^{\mu\nu}(J_{z'} = +2) = e_X^\mu(+)\bar{e}_X^\nu(+), \text{ etc...}$$

- Amplitude with field strength tensor $F^{\mu\nu}$ (e.g. **graviton couplings**):

$$\begin{aligned} A(X_{J=2} \rightarrow VV) = & \Lambda^{-1} \left[2g_1^{(2)} t_{\mu\nu} F^{*1,\mu\alpha} F^{*2,\nu\alpha} + 2g_2^{(2)} t_{\mu\nu} \frac{q_\alpha q_\beta}{\Lambda^2} F^{*1,\mu\alpha} F^{*2,\nu\beta} \right. \\ & + g_3^{(2)} \frac{\tilde{q}^\beta \tilde{q}^\alpha}{\Lambda^2} t_{\beta\nu} (F^{*1,\mu\nu} F^{*2}_{\mu\alpha} + F^{*2,\mu\nu} F^{*1}_{\mu\alpha}) + g_4^{(2)} \frac{\tilde{q}^\nu \tilde{q}^\mu}{\Lambda^2} t_{\mu\nu} F^{*1,\alpha\beta} F^{*(2)}_{\alpha\beta} \\ & + m_V^2 \left(2g_5^{(2)} t_{\mu\nu} \epsilon_1^{*\mu} \epsilon_2^{*\nu} + 2g_6^{(2)} \frac{\tilde{q}^\mu q_\alpha}{\Lambda^2} t_{\mu\nu} (\epsilon_1^{*\nu} \epsilon_2^{*\alpha} - \epsilon_1^{*\alpha} \epsilon_2^{*\nu}) + g_7^{(2)} \frac{\tilde{q}^\mu \tilde{q}^\nu}{\Lambda^2} t_{\mu\nu} \epsilon_1^* \epsilon_2^* \right) \\ & + g_8^{(2)} \frac{\tilde{q}_\mu \tilde{q}_\nu}{\Lambda^2} t_{\mu\nu} F^{*1,\alpha\beta} \tilde{F}^{*(2)}_{\alpha\beta} + g_9^{(2)} t_{\mu\alpha} \tilde{q}^\alpha \epsilon_{\mu\nu\rho\sigma} \epsilon_1^{*\nu} \epsilon_2^{*\rho} q^\sigma \\ & \left. + \frac{g_{10}^{(2)} t_{\mu\alpha} \tilde{q}^\alpha}{\Lambda^2} \epsilon_{\mu\nu\rho\sigma} q^\rho \tilde{q}^\sigma (\epsilon_1^{*\nu}(q \epsilon_2^*) + \epsilon_2^{*\nu}(q \epsilon_1^*)) \right] \end{aligned}$$

The five angles
